

2021 Mar 23

Woebot for Substance Use Disorders

NCT04096001

Statistical Analysis Plan

Descriptive statistics (means and frequencies) will be used to describe the sample and examine program feasibility and acceptability ratings. Change scores (pre- minus post-treatment) will be calculated and bivariate correlations will be used to examine associations between changes in substance use (i.e., AUDIT-C scores, DAST-10 scores, and substance use occasions), as well as confidence, depression, and anxiety scores. T-tests will be conducted to examine changes from pre- to post-treatment in substance use, confidence, mood and pain by participants' current therapy and psychiatric medication status.
