Overall Summary

Postoperative complications occur in up to 50% of patients and are associated with higher mortality, cancer recurrence rate

 <p><i>Ministero della Salute</i> Direzione Generale della Ricerca Sanitaria e Biomedica e della Vigilanza sugli Enti</p> <p>BANDO RICERCA FINALIZZATA 2018 esercizio finanziario anni 2016-2017</p>	Project Title: Multimodal prehabilitation in colorectal cancer patients to improve functional capacity and lower postoperative complications: A randomized clinical trial.

and hospital costs. The number and severity of complications are closely related to preoperative functional capacity and nutritional status. This study aims to determine the effect of prehabilitation on patients' functional capacity and postoperative complications. It is a randomized trial including 112 patients undergoing colorectal surgery for cancer. Patients will be allocated to intervention group receiving 4 weeks trimodal prehabilitation (N=56) or control group receiving no prehabilitation (N=56). After surgery, both groups will follow 8 weeks rehabilitation based on Enhanced Recovery After Surgery (ERAS) guidelines. The primary endpoint is functional capacity, secondary outcomes include postoperative complications and a cost-effectiveness analysis. Multimodal prehabilitation is expected to increase functional capacity and lower postoperative complications.

Background / State of Art

Postoperative complications occur in up to 50% of patients undergoing cancer colorectal resection and are associated with poor prognosis, increased costs, and lower health-related quality of life (HRQoL).¹⁻³ Even with no complications, major surgery is associated with 20 to 40% reduction in physiological and functional capacity and higher level of fatigue 6 to 8 weeks after surgery.⁴ Functional performance reduction is correlated with preoperative health status and degree of surgical trauma as well as intensity of metabolic response. Patients may also need postoperative chemo- and radiation therapy, more physically challenging if surgery has lowered functional capacity. Many negative effects of major surgery can be reduced attenuating the surgical stress response by Enhanced Recovery After Surgery (ERAS) programs, to facilitate return of functional activities and accelerate convalescence.⁵ However, the postoperative period may not be the best time to ask surgical patients to change their nutrition and exercise habits, as they may be tired, anxious, and depressed awaiting for additional treatments. Also, poor baseline physical performance capacity, particularly in the elderly and frail patients, increases the risk of complications and prolongs recovery after major surgery. Thus, patients' prehabilitation, the process of enhancing functional capacity to withstand an incoming stressor between the time of cancer diagnosis and surgical treatment, may represent a better time frame to intervene in factors contributing to the recovery process enhancing recuperation of postoperative functional capacity.^{6,7} A recent systematic review including 20 studies evaluating the prehabilitation program in gastrointestinal cancer surgery, strongly supported multimodal rather than unimodal interventions, but highlighted the need for further prospective studies, also evaluating health economic outcomes, before the definitive value of prehabilitation programs can be clarified.⁸

Hyphotesis and Specific AIMS

Hyphotesis and Significance:

Recent level I evidence from North America suggests that optimizing functional exercise capacity alone before colorectal surgery can result in better physical performance, but not significant fewer postoperative complications and shorter hospital length of stay (LOS).^{9,10}

In this study, we hypothesise that the implementation of a trimodal prehabilitation program (physical exercise, psychological support and nutritional optimization) in patients undergoing ERAS colorectal resection for cancer with standard rehabilitation will determine: 1) better physical performance at 8 weeks after surgery, 2) decrease in postoperative

 <p><i>Ministero della Salute</i> Direzione Generale della Ricerca Sanitaria e Biomedica e della Vigilanza sugli Enti BANDO RICERCA FINALIZZATA 2018 esercizio finanziario anni 2016-2017</p>	Project Title: Multimodal prehabilitation in colorectal cancer patients to improve functional capacity and lower postoperative complications: A randomized clinical trial.

Project Type: Ordinary/Progetti ordinari di Ricerca Finalizzata	

complications and LOS, and 3) reduced direct and indirect costs.

To date, there is no evidence of the implementation of such a trimodal prehabilitation program in Italy and the only published RCT was conducted in Canada, a very different social, economic and environmental context. Furthermore, in this study the mean age of patients who underwent prehabilitation was 65.7 years and 74% were ASA I-II.

Preliminary Data:

Since 2013, at the University Hospital of Ferrara a multidisciplinary team including surgeons, anaesthesiologists, and nurses has implemented an integrated ERAS perioperative care protocol in colorectal surgery, founded on elements selected based on high-grade evidence of clinical efficacy.⁵ Recently, also two dietitians, a geriatrician with consolidated experience in sarcopenia and performance-based functional assessment of older patients, two sports medicine physicians, and two psycho-oncologists have joined the team to integrate the ERAS methodology with a prehabilitation colorectal program.

Recently, the prehabilitation protocol has been applied by the team to a small number (N=10) of patients who underwent ERAS colonic resection for cancer. According to the protocol, patients were evaluated at baseline and after a 4-week prehabilitation program with the 6-minute walking test (6MWT). Mean baseline walking capacity was 571.5 ± 64.1 m, while following the 4-week prehabilitation program increased to 618.8 ± 57.5 m. At present, we are still collecting the postoperative data on walking capacity.

Picture to support preliminary data:

Boxplot preliminary data.jpg

Specific Aim 1:

To compare the postoperative functional capacity in two groups of colorectal cancer patients undergoing colorectal resection following an ERAS program, one treated with trimodal prehabilitation before surgery followed by standard rehabilitation (experimental group) and the other undergoing standard rehabilitation alone after surgery (control group).

Specific Aim 2:

To compare the postoperative complications in the experimental group versus the control group.

Specific Aim 3:

To compare both direct (hospital) and indirect (social and non-hospital health care) costs in the experimental group versus the control group.

Experimental Design Aim 1:

Single centre, single-blind, RCT with 2 groups. Written informed consent will be obtained. Ethical approval was obtained by the local Ethics Committee.

Patients of age >17 years undergoing elective colorectal resection for cancer are eligible. Exclusion criteria are metastatic disease, severe walking impairments, renal failure stage >2, ASA score >3, preoperative chemo-radiation therapy.

Patients will be randomized either to prehabilitation intervention group, receiving 4-week prehabilitation, or to control receiving no prehabilitation. Both groups will receive rehabilitation following current international ERAS guidelines.

The primary outcome for functional capacity is measured by the 6MWT, chosen because it is a validated, objective measure of colorectal surgery recovery integrating all components of physical activity.¹⁰

Secondary outcomes for aim 1 are: a) cardiopulmonary exercise testing (CPET), b) handgrip strength, c) sit-to-stand, d)

 <p><i>Ministero della Salute</i> Direzione Generale della Ricerca Sanitaria e Biomedica e della Vigilanza sugli Enti</p> <p>BANDO RICERCA FINALIZZATA 2018 esercizio finanziario anni 2016-2017</p>	Project Title: Multimodal prehabilitation in colorectal cancer patients to improve functional capacity and lower postoperative complications: A randomized clinical trial.

Research Type: b) Change-promoting: valutare la sicurezza, efficacia, costo-efficacia, di trattamenti/tecnologie/interventi sanitari per cui sussistano significativi margini di incertezza relativamente agli aspetti menzionati, anche con studi clinici di fase 3 e 4	Applicant Institution: Emilia-Romagna
Project Type: Ordinary/Progetti ordinari di Ricerca Finalizzata	

body composition and nutritional status, e) depression/anxiety, f) HRQoL.

All measures will be recorded in both study groups at baseline (beginning of prehabilitation period) and prior to surgery (end of prehabilitation period) to measure the effect of intervention, and at 4 and 8 weeks after surgery to assess the impact of the intervention throughout the perioperative period. The person performing the 6MWT and helping the subjects with questionnaires and forms will not be aware of the study hypothesis and will not have access to data.

ELEMENTS OF TRIMODAL PREHABILITATION:

1) EXERCISE PROGRAM. A sports physician will assess patients mobility and capacity to exercise. All participants will undergo CPET and the exercise intensity will be defined and personalized. Based on the evaluation, the sports physician will prepare, explain and coordinate a personalized program.¹¹

Patients will receive 3 supervised trainings/week including interval and resistance training. They will be instructed on how to conduct aerobic exercises at home (walking or cycling), initially at 50% of the calculated heart rate reserve aiming at 60 min 4 times/week as tolerated by the patient. Accurate measurement of compliance is critical to determine the true effect of prehabilitation; therefore, patients will always wear an accelerometer during the 4 weeks of intervention.

2) NUTRITIONAL SUPPLEMENTS. The goal is to attain an anabolic preoperative state in all patients, improving in cachectic patients the lean body mass amount. At baseline, dietician will assess patients nutritional status (body composition, caloric balance and dietary intake). Nutritional supplements will be tailored to patient food intake. If there is weight loss/cachexia and indication for extra feeding and no medical limitation increased protein intake is aimed at 1.5 g/kg/day. Extra supplements as multivitamins and 2 weeks of omega-3 fatty acids from fish oil will be added.

3) PSYCHOLOGICAL COPING. Patients undergoing surgery for cancer may be anxious with depression symptoms which may influence social and functional activities. Thus, patients will be evaluated by a trained psycho-oncologist using validated questionnaires (GAD-7, PHQ-9).^{12,13} The goal is to reduce anxiety and avoid depression by putting the patients in a well-informed active coping role in dealing with the disease. If indicated, patients will receive 90 min of psychological intervention in the first session and more sessions during the 4 weeks of prehabilitation. In the first preoperative session, the 1st hour will address the patients anxieties, coping strategies, and post-operative expectations. The last 30 min will be devoted to teaching relaxation techniques and breathing exercises and to give written instructions for home practice.

CONTROL GROUP

Patients will be encouraged to walk daily for at least 30 min, to perform breathing exercises for 5 min per day and 5-10 min of aerobic exercises.

Experimental Design Aim 2:

The Clavien-Dindo classification and the Comprehensive Complication Index (CCI) as a combined outcome measure of morbidity and mortality will be used to assess complications.^{14,15} CCI is calculated as the sum of all complications that are weighted for their severity (multiplication of the median reference values from patients and physicians). The final formula yields a continuous scale to rank the severity of any combination of complications from 0-100 in a single patient. The CCI showed high sensitivity detecting treatment effect differences, inverse correlation with postoperative health status, and high correlation with the results of patient-rated single and multiple complications on conjoint analysis ($r=0.94$, $P<0.001$). The CCI summarizes all postoperative complications and is more sensitive than existing morbidity endpoints.¹⁵ Both indexes will be assessed 4 weeks after surgery.

Experimental Design Aim 3:

The analysis of social costs for patients in the prehabilitation and control groups will be assessed by cost-effectiveness analysis, evaluating both direct and indirect costs, including the value of time spent by unpaid caregivers (formal and informal) in assisting the patients. Costs and benefits will be evaluated from the societal point of view. Costs (both public

 <p><i>Ministero della Salute</i> Direzione Generale della Ricerca Sanitaria e Biomedica e della Vigilanza sugli Enti</p> <p>BANDO RICERCA FINALIZZATA 2018 esercizio finanziario anni 2016-2017</p>	Project Title: Multimodal prehabilitation in colorectal cancer patients to improve functional capacity and lower postoperative complications: A randomized clinical trial.

Research Type: b) Change-promoting: valutare la sicurezza, efficacia, costo-efficacia, di trattamenti/tecnologie/interventi sanitari per cui sussistano significativi margini di incertezza relativamente agli aspetti menzionati, anche con studi clinici di fase 3 e 4	Applicant Institution: Emilia-Romagna
Project Type: Ordinary/Progetti ordinari di Ricerca Finalizzata	

and private as well as direct and indirect) and outcomes (health status and quality of life of both patients and caregivers) will be compared. Indicators of socio-economic characteristics, perceived quality of life (Short Form-36, EORTC 29, 30), and patients use of social and health care resources will be collected. Relevant caregivers' information will be acquired by ad hoc questionnaire. Direct costs (e.g., enhancement of costs and nursing care workload related to prehabilitation protocol) will be measured through the information collected by questionnaires. Indirect costs will be evaluated through two alternative approaches: 1) replacement cost (revealed preferences or proxy good); 2) contingency evaluation based on data collected by caregivers questionnaire. An analysis of the incremental cost-effectiveness ratio will be carried out over a 2-year period.

Metodologies and statistical analyses:

We will conduct a single centre single blind randomized clinical trial. Patients will be randomized with a 1:1 allocation by means of randomization software. We plan to enrol 112 patients, 56 per group. The sample size calculation was based on the primary aim, the 6MWT. We used preliminary data from a sample (N=10) who underwent ERAS colonic resection for cancer, evaluated at baseline and after a 4-week prehabilitation program with 6MWT. Mean baseline walking capacity was 571.5±64.1 meters, while following the 4-week prehabilitation program increased to 618.8±57.5 m with a mean change of +47.2±57.5 m. We hypothesized that 8 weeks after surgery the difference in the 6MWT between the prehabilitation and the control group would be about 45 m. Assuming a similar baseline walking capacity between the two study groups and an 8 weeks difference of about 45 ± 57 meters, with an alpha level of 0.05 a power of 80%, the required sample size is 51 patients per group. Assuming a 10% attrition we planned to enrol 112 patients. Univariate analyses will be conducted to determine differences between groups on one time point with independent t-tests for continuous variables and chi-square analyses for categorical variables. Generalized mixed models for repeated measure will be used to analyse the effect of the prehabilitation program on several outcomes. Linear models will be used for continuous outcomes (primary research question) and logistic models for dichotomous outcomes. Socio-demographic and clinical characteristics will be analysed as time-invariant predictors.

Expected outcomes:

- AIM 1. Better functional capacity (6MWT) in the experimental group (prehabilitation) at 8 weeks after surgery.
- AIM 2. Decrease in postoperative complications due to the trimodal prehabilitation program.
- AIM 3. Higher net social benefits for patients on prehabilitation compared to controls. We expect lower tangible costs and higher effectiveness and better quality of life for patients and caregivers.

Risk analysis, possible problems and solutions:

- PATIENTS REFUSAL. Based on preliminary data, about 20% of patients may decline participation due to work commitments or unwilling to exercise. Thus, we will enrol patients over a 30-month period. In a recent study on implementation of an ERAS program for patients <81 years old undergoing bowel resection for colonic cancer at our institution we enrolled about 40 patients/year. Thus, considering the wider age range and the inclusion of rectal cancer with no preoperative treatment we are confident to reach the required sample. Some patients may fear to delay surgery, but the usual wait at our institution for elective cancer surgery is about 5 weeks.
- LACK OF PATIENTS BLINDNESS. As patients in the study cannot be masked to the intervention, controls may increase their physical activity awaiting for surgery due to the hypothesised potential benefit of prehabilitation. Thus, in order to monitor this potential bias, we planned to objectively assess in both groups the amount of preoperative physical activity using an accelerometer. These data may be helpful for the interpretation of the results.

- RISK OF OBSERVER BIAS. The assessors will be masked regarding the study group of the patients (single-blind study design).

Significance and Innovation

Routine standard perioperative care currently does not include special nutrition, exercise and psychological anxiety support before surgery. In colorectal patients undergoing surgery morbidity and mortality remains high with reduced physiological and functional capacity. Patient lifestyle is a risk factor for cancer which may impair the nutritional status that in turn aggravates deconditioning and muscle wasting, suggesting that improvement in both nutrition and functional exercise capacity may be of benefit. Traditional approaches targeted the postoperative period for rehabilitation and lifestyle changes, but postoperative complications are closely related to preoperative functional, nutritional and psychological status and the preoperative period may be a better timeframe to intervene. Implementing a trimodal program targeting those problems would represent a very innovative approach that, if beneficial, will promote a radical innovation in patients' preparation for surgery.

Description of the complementary and synergy research team

The integrated activity of several distinct professionals with different and complementary scientific backgrounds is required. A multidisciplinary prehabilitation team was constituted in 2016 integrating the ERAS group, including surgeons, anaesthesiologists, and nurses with dietitians, a geriatrician experienced in sarcopenia and functional assessment, sports medicine physicians and psycho-oncologists.

Formal meetings of the multidisciplinary prehabilitation group will be held on a monthly basis to revise and discuss the care pathway of enrolled patients, analyse and solve potential problems.

Patients will be seen in the office by the surgeon following colorectal cancer diagnosis and screened for eligibility; preoperative staging imaging will be prescribed and surgery will be scheduled approximately 4 weeks after the end of the diagnostic work-up. Patients who provide informed consent for the study, will be randomized to either prehabilitation or control group and will be sent to sports physician, for baseline evaluation. Patients allocated to prehabilitation will be also evaluated by psycho-oncologist and dietician and will start the trimodal prehabilitation program. Patients in both study groups will be reassessed the week before operation and at 4 and 8 weeks after surgery by the sports physician.

A specifically trained and dedicated research case manager will coordinate the research care protocol, including assessments.

Training and tutorial activities

The ERAS group visited in December 2014 the McGill University Health Centre in Montreal (CAN) where a perioperative program including prehabilitation was investigated (<https://www.mcgill.ca/peri-op-program/>). A conference on Surgical Prehabilitation was also attended at Mc Gill University in June 2017. At that time, meetings with the local multidisciplinary team (anesthesiologists, surgeons, nurses, kinesiologists, nutritionists) were held, and the organization as well as pattern of prehabilitation was seen and discussed.

We then defined a prehabilitation care protocol founded on the elements selected on available evidence of clinical efficacy. Members of our prehabilitation team will formally visit the team at McGill University to further specialize on trimodal prehabilitation, and will then share the training received with the other staff members.

The McGill team will provide support to the project also by discussing and analysing the data and difficulties throughout the process.

- Screening form for patients' selection and enrolment
 - Form for baseline data collection
 - Form for follow-up data collection
 - Investigator's manual
- 2-3 MONTHS
- Kick-off investigators' meeting
 - Assessors recruitment and formal training
 - Setting up electronic database
- 4-33 MONTHS
- Patients enrolment and delivery of interventions and assessments
 - Electronic data entry
- 21-22 MONTHS
- Interim analysis
- 34-36 MONTHS
- Statistical analysis and manuscript drafting

Milestones 18 month

- 1) Development of the dedicated web-based electronic database;
- 2) Enrolment of 40% (N=45) of scheduled patients for both study groups;
- 3) Complete follow-up and data entry for 25-30% of the patients enrolled.

Milestones 36 month

- 1) Enrolment of 100% of scheduled patients (115 patients);
- 2) Complete follow-up assessment and electronic data entry for all the patients enrolled;
- 3) Complete statistical and cost-effectiveness data analysis;
- 4) First manuscript drafting.

Equipment and resources available

1. Facilities Available

- SURGERY. Patients are usually seen before surgery in the preoperative clinic to determine if they are fit for surgery and to adjust their medication. Routine standard perioperative clinical care at our institution currently do not include special nutrition, exercise, and psychological support to cope with anxiety before surgery, but does include preoperative smoking cessation and hematinic optimization (target hemoglobin level 11 g/dl). After surgery, they are not offered an in-hospital exercise program, but are given generic instructions by the surgeons about mobilization and return to normal activities. Some patients may be referred to a physiotherapist by their treating doctor. The introduction of interventional measures of nutrition, exercise and coping strategies is solely for research purposes. A laparoscopic approach is elected for colorectal cancer resection. Perioperative care is guided by a standardized multi-element evidence-based comprehensive ERAS pathway following the consensus review on best care for patients undergoing colorectal surgery (Fearon KC, et al. Clin Nutr 2005;24:466-77).
- CENTRE FOR BIOCHEMICAL STUDIES APPLIED TO SPORTS MEDICINE UNIVERSITY OF FERRARA - AZIENDA USL FERRARA. Experienced centre for development, validation and implementation of comprehensive personalized protocols of physical activity for patients with several diseases including cardiovascular, metabolic and neurological diseases. The facility is equipped with all the instruments required for the evaluation of functional exercise capacity, including CPET.
- CENTRE FOR CLINICAL EPIDEMIOLOGY UNIVERSITY OF FERRARA. Experienced centre for the design and conduction of clinical studies including RCTs and for biostatistical analysis with quality data control. The centre includes a methodologist for clinical study (MPH degree) and a biostatistician with a postgraduate degree in biostatistics.

2. Subcontract

- RESEARCH CENTRE ON HEALTH MANAGEMENT UNIVERSITY OF FERRARA. An economist expert in health management is included in the research team in order to plan and conduct the cost-effectiveness and efficacy analysis.
- DIETITIAN. As part of the trimodal prehabilitaiton intervention, patients will be evaluated perioperatively (at baseline, immediately before surgery and at 4 and 8 weeks after surgery) by a dietician for nutritional status assessment and nutritional supplementation if needed.

Translational relevance and impact for the National Health System (SSN)

Trimodal prehabilitation can greatly affect the quality of care within the SSN affecting three dimensions:

- 1) THE STRUCTURE (where health care is delivered). Better postoperative physical function, reduced morbidity and length of hospital stay should decrease both hospital and social costs as well as support from other health-care institutions (nursing homes, family doctors). In addition, waiting lists in public hospitals might be shortened as rapid turnover yields increasing bed availability. Optimized performance and use of resources may provide financial benefits to the hospital, stimulating a wider application of such methodology within the SSN;
- 2) THE PROCESS (care received). Better physical function, reduced morbidity, accelerated recovery may all improve the quality of care;
- 3) THE OUTCOMES (mortality, morbidity, length of stay). Trimodal prehabilitation may improve the outcome of patients by decreasing postoperative morbidity, promoting safety and improving quality of life.

 <p><i>Ministero della Salute</i> Direzione Generale della Ricerca Sanitaria e Biomedica e della Vigilanza sugli Enti BANDO RICERCA FINALIZZATA 2018 esercizio finanziario anni 2016-2017</p>	Project Title: Multimodal prehabilitation in colorectal cancer patients to improve functional capacity and lower postoperative complications: A randomized clinical trial.
Project Code: RF-2018-12367272	Principal Investigator: FEO CARLO
Research Type: b) Change-promoting: valutare la sicurezza, efficacia, costo-efficacia, di trattamenti/tecnologie/interventi sanitari per cui sussistano significativi margini di incertezza relativamente agli aspetti menzionati, anche con studi clinici di fase 3 e 4	Applicant Institution: Emilia-Romagna

Position Title	Chief, U.O. Chirurgia Generale Provinciale; Associate professor						

Personal Statement

- To implement a trimodal prehabilitation program (physical exercise, psychological support and nutritional optimization) in patients undergoing ERAS colorectal resection for cancer with standard rehabilitation, expecting better physical performance at 8 weeks after surgery, decreased postoperative complications, and reduced direct and indirect costs compared to controls (patients undergoing ERAS colorectal resection for cancer with standard rehabilitation and NO prehabilitation).
- Conception of the study and research hypothesis, enroll and operate on patients, coordination of the study.

Budget Justification

1a Staff Salary	salary Pi, Co-PI, RUO and other collaborators
1b Researchers' Contracts	contracts for the management of the whole study workup
2 Equipment (Leasing - Rent)	depreciation of equipment value - specific equipment for the study: Accelerometer x 10, Bioelectrical impedance analyser x 2 for body composition analysis, Manual idraulic dynamometer x 2 for grip strength evaluation, laptops for real time data entry
3a Supplies	consumables and devices useful for the successful completion of the project
3b Model Costs	none
3c Subcontracts	this budget will cover expences for economical analysis and nutritional evaluation of patients on prehabilitation
3d Patient Costs	none
4 IT Services and Data Bases	software related to the development of the project
5 Publication Costs	abstract submission for interim results and full papers for final results
6 Convegni	partecipation in workshop to disseminate results
7 Travels	travels will be needed to attend pertinent meeting of specific interest to the project
8 Overheads	general costs generated to project management
9 Coordination Costs	logistic costs relating to data presentation at meeting and congresses
