

Table 1^A. Demographic, clinical characteristics, and outcomes of the study cohort (N = 161).

Variable	No of studied patients=161
	N (%)
Sex	
Male	74 (46%)
Female	87 (54%)
Age (Years): Mean \pm SD	55.26 \pm 9.94
BMI (Kg/m ²): Mean \pm SD	28.25 \pm 2.18
Pre-admission morbidity	
Yes	72 (44.7%)
No	89 (55.3%)
Diagnosis	
Aspiration pneumonia	1 (0.6%)
Bronchopneumonia	47 (29.2%)
CAP	27 (16.8%)
Lobar pneumonia	86 (53.4%)
Causative organism	
E. coli	19 (11.8%)
E. coli+ candida	6 (3.7%)
H. influenza	12 (7.5%)
Klebsiella	26 (16.1%)
Mycobacterium	3 (1.9%)
Pseudomonas. aeruginosa	27 (16.8%)

Parainfluenza	2 (1.2%)
Staphylococcus aureus	19 (11.8%)
Streptococcus pneumoniae	20 (12.4%)
Sepsis without microbiological confirmation	27 (16.8%)
SOFA: Mean \pm SD	
On ICU admission	3.48 \pm 0.79
Day-5	4.93 \pm 1.63
Clinical deterioration on day-5 (first occurrence on fifth calendar day after T0).	
Yes	48 (30%)
No	113 (70%)
SOFA \geq 2 points increase on fifth calendar day after T0.	
Yes	47 (29.2%)
No	114 (70.8%)
Septic shock on fifth calendar day after T0.	
Yes	44 (27.3%)

No	117 (72.7%)
Mortality on fifth calendar day after T0	
Yes	9 (5.5%)
No	152 (94.5%)
Very early clinical deterioration (T0-day 4)	
Yes	18 (11.2%)
No	143 (88.8%)
SOFA ≥ 2 points increase (T0-day 4)	
Yes	15 (9.3%)
No	146 (92.7%)
Septic shock (T0-day 4)	
Yes	13 (8%)
No	148 (92%)
T0-day 4 mortality	
Yes	11 (6.8%)
No	150 (93.2%)

AKI	
Yes	26 (16.1%)
No	135 (83.9%)
MV	
Yes	52 (32.3%)
No	109 (67.7%)
Liver failure	
Yes	4 (2.5%)
No	157 (97.5%)
ICU stay (days): Mean \pm SD	8.07 \pm 0.72
ICU mortality (during entire ICU stay)	
Yes	28 (17.4%)
No	133 (82.6%)
28 days in-hospital mortality (post-ICU discharge)	
Yes	4 (2.5%)
No	157 (97.5%)

SD: Standard deviation

SOFA= sequential organ failure assessment AKI= acute kidney injury MV= mechanical ventilation. CAP= community acquired pneumonia.

- ICU mortality of 28 patient (17.4%) was defined as death occurring at any time during the entire ICU stay regardless of the duration (during ICU care).
- The 28-day in-hospital mortality of 4 patients (4/ 2.5%) represents the additional patients who died within 28 days after ICU discharge, among ICU survivors and during the same hospitalization period. No patients were lost to in-hospital follow-up.
- Components of clinical deterioration were not mutually exclusive; individual patients could meet more than one criterion (e.g., SOFA increase with septic shock and/or death), therefore component counts may exceed the total number of deteriorated patients.
- Sepsis without microbiological confirmation refers to clinically suspected sepsis in which no pathogen was recovered from culture or molecular testing despite compatible clinical features.
- Microbiologically confirmed infection was defined as recovery of a plausible pathogen from a normally sterile site (blood and bronchoalveolar lavage detection) or by molecular assay judged clinically causative.

Table 1^B. Differential demographic, clinical and diagnostic criteria between early deterioration and non-deterioration group (N=161).

Variable	Overall (N=161)	Early Deterioration (N=66)	No Early Deterioration (N=95)
Demographics

Multicollinearity assessment for day-5 incident and very early deterioration (Table A).

Predictor	VIF (day-5 incident deterioration)	Tolerance (day-5 incident deterioration)	VIF (Very Early Deterioration)	Tolerance (Very Early Deterioration)
B lymphocytes	4.709	0.212	4.382	0.228
CD4	4.041	0.248	3.945	0.254
CD8	3.956	0.253	3.460	0.289
MDW	3.215	0.311	3.066	0.326
PDW	4.160	0.240	3.976	0.252
T cells	2.334	0.428	2.320	0.431
MPV	1.673	0.598	1.395	0.717
TNF- α	1.155	0.866	Excluded	Excluded
PCT	Excluded	Excluded	Excluded	Excluded

Threshold for parameters

VIF>5= problematic collinearity. VIF<5. No harmful collinearity. Tolerance >0.1= equivocal Tolerance>0.2= no strong collinearity.

Table M: Bootstrap-validated ROC performance of individual biomarkers for day-5 incident clinical deterioration.

Biomarker	Original AUC	Bootstrap AUC (95% CI)	Optimism
MDW	0.878	0.872 (0.815-0.929)	+0.006
PDW	0.872	0.865 (0.810-0.920)	+0.007
CD8	0.868	0.861 (0.802-0.920)	+0.007
CD4	0.832	0.825 (0.760-0.890)	+0.007
TNF α	0.676	0.669 (0.575-0.763)	+0.007
MPV	0.686	0.679 (0.595-0.763)	+0.007
B lymphocytes	0.717	0.710 (0.630-0.790)	+0.007
T cells	0.668	0.661 (0.565-0.757)	+0.007
PCT	0.513	0.507 (0.405-0.609)	+0.006

-Optimism= (Apparent AUC – Bootstrap AUC).

Bootstrap validation demonstrated minimal optimism in ROC performance for all biomarkers (optimism ≈ 0.006 – 0.007), suggesting that apparent AUCs were not materially inflated by overfitting. MDW, PDW, CD8, CD4 retained good discrimination after correction, supporting the stability of their prognostic signal. In contrast, TNF- α , MPV, and PCT showed only modest discrimination despite similarly low optimism, suggesting limited standalone prognostic value rather than model instability.

Table N; Bootstrapping validation of multiple logistic regression of the day-5 incident deterioration.

Parameter	Original aOR (95% CI)	Bootstrap aOR (95% CI)	Coefficient bias	% Selected
MDW	1.675 (1.196-2.347)	1.682 (1.205-2.360)	+0.007	92%
B lymphocytes	1.040 (1.012-1.068)	1.043 (1.015-1.072)	+0.003	68%
PDW	1.299 (0.941–1.790)	1.285 (0.925–1.765)	–0.014	88%
CD4	0.984 (0.972-0.996)	0.986 (0.974-0.998)	+0.002	55%
CD8	0.990 (0.983-0.998)	0.992 (0.985-1.000)	+0.002	52%
TNF α	1.081 (1.013-1.154)	1.084 (1.016-1.158)	+0.003	45%
Shrinkage Factor: 0.96				

Coefficient bias=Bootstrap Estimate–Original Estimate.

Bootstrap resampling confirmed coefficient stability, with calibration slope 0.96 (indicating minimal shrinkage required) and optimism <4%. MDW and PDW demonstrated strong robustness with selection frequencies >85%, while CD4 and CD8 remained consistently retained, supporting the reliability of the multiple regression prognostic associations. TNF- α showed lower stability, suggesting a more context-dependent effect.

Table O: Penalized (Firth) logistic regression and bootstrap stability of T0 biomarkers for day-5 incident deterioration.

Biomarker	Apparent β	Penalized β	Penalized aOR	Selection frequency in bootstrap resamples (%)
MDW	0.51	0.49	1.64	94%
PDW	0.04	0.037	1.04	89%
CD8	-0.01	-0.009	0.99	82%
CD4	-0.016	-0.015	0.98	70%
T cells	-0.42	-0.36	0.70	65%
B lymphocytes	-0.37	-0.33	0.72	85%
MPV	0.07	0.05	1.05	72%
TNF- α	0.08	0.07	1.07	48%
PCT	0.01	0.00	1.00	28%

Penalized β coefficients correspond to a one-unit increase in the original biomarker scale.

Penalized logistic regression using Firth's correction was applied to mitigate small-sample bias and separation effects. Penalization consistently shrank coefficients toward the null while preserving the direction and relative magnitude of effects, indicating that the apparent associations were not driven by sparse-data inflation. MDW remained the strongest and most stable independent predictor (penalized aOR 1.64; stability 94%), followed by PDW and B lymphocytes, whose effects were directionally coherent and frequently retained across bootstrap samples. CD4 and CD8 demonstrated weaker but consistent inverse associations, suggesting immune-protective contributions. In contrast, TNF- α and PCT exhibited low stability and near-null penalized effects, indicating limited independent prognostic value after accounting for model complexity and small-sample bias. Overall, penalization confirmed the robustness of MDW and PDW while appropriately attenuating fewer stable signals.

Table P: Bootstrap-validated ROC performance of biomarkers for prediction of very early clinical deterioration.

Biomarker	Original AUC	Bootstrap AUC (95% CI)	Optimism
B lymphocytes	0.906	0.901 (0.841-0.962)	-0.005
PDW	0.894	0.889 (0.843-0.935)	-0.005
CD8	0.900	0.892 (0.841-0.943)	-0.008
MDW	0.897	0.891 (0.844-0.938)	-0.006
T cells	0.867	0.861 (0.787-0.935)	-0.006
MPV	0.792	0.785 (0.699-0.871)	-0.007
CD4	0.822	0.816 (0.724-0.908)	-0.006
TNF- α	0.592	0.585 (0.440-0.740)	-0.007
PCT	0.521	0.510 (0.360-0.670)	-0.011

Bootstrap validation showed minimal optimism in ROC estimates (≤ 0.01), with preserved discrimination for PDW, MDW, CD8 and B lymphocytes, indicating that observed performance

suggests genuine prognostic signal rather than resubstitution bias. In contrast, TNF- α and PCT showed near-random discrimination despite similarly low optimism, reflecting limited biological contribution rather than model instability.

Table Q: Bootstrap validation of logistic regression predictors for very early clinical deterioration.

Parameter	Original aOR (95% CI)	Bootstrap aOR (95% CI)	Coefficient bias	% Selected in Bootstraps
PDW	1.674 (1.283-2.183)	1.682 (1.245-2.198)	+0.008	98%
B lymphocytes	0.969 (0.937-1.001)	0.972 (0.941-1.004)	+0.003	42%
MPV	1.337 (0.976-1.831)	1.342 (0.982-1.845)	+0.005	28%
MDW	1.465 (0.826-2.600)	1.472 (0.812-2.612)	+0.007	22%
T cells	1.000 (0.992-1.009)	1.001 (0.993-1.010)	+0.001	12%
CD4	1.007 (0.995-1.019)	1.004 (0.992-1.016)	-0.003	4%
CD8	0.987 (0.960-1.014)	0.991 (0.963-1.020)		

			+0.004	3%
--	--	--	--------	----

In the bootstrap-validated model, PDW demonstrated excellent robustness (98% selection, negligible coefficient bias), whereas other biomarkers showed lower retention, indicating limited independent contribution. This suggests PDW as a consistent and stable prognostic marker for very early deterioration. Selection frequency reflects model stability rather than statistical significance.

Table R: Penalized (Firth) penalization for very early deterioration.

Biomarker	Apparent β	Penalized β	Penalized aOR	Bootstrap Stability (%)
PDW	0.37	0.34	1.40	86%
B lymphocytes	-0.43	-0.40	0.67	79%
T cells	-0.33	-0.31	0.73	72%
MDW	0.52	0.49	1.63	90%
CD8	-0.10	-0.09	0.91	65%
CD4	-0.08	-0.07	0.93	62%
MPV	0.06	0.05	1.05	48%
TNF- α	0.08	0.07	1.07	48%
PCT	0.01	0.00	1.00	28%

Penalized logistic regression using Firth's correction attenuated coefficient magnitudes while preserving directionality, suggesting that apparent associations were not driven by sparse-data bias. PDW and MDW remained the most stable independent predictors with high bootstrap stability (>85–90%). B lymphocytes and T cells showed coherent inverse associations consistent with protective immune phenotypes. In contrast, MPV, TNF- α , and PCT collapsed toward the null, confirming limited independent prognostic contribution after penalization.
