2. Abstract

This is a non-randomized, non-interventional study that is part of the *Randomized Controlled Trials Duplicated Using Prospective Longitudinal Insurance Claims: Applying Techniques of Epidemiology* (RCT-DUPLICATE) initiative (www.rctduplicate.org) of the Brigham and Women's Hospital, Harvard Medical School. It is intended to assess the comparative effectiveness of tirzepatide vs semaglutide on cardiovascular outcomes among patients at cardiovascular risk with overweight or obesity but without diabetes treated in clinical practice.

The SELECT trial (NCT03574597) demonstrated that semaglutide reduces major adverse cardiovascular events in individuals with established cardiovascular disease and overweight or obesity but without diabetes.¹ Whether tirzepatide provides similar cardiovascular benefit in patients without diabetes is being evaluated in the ongoing placebo-controlled SURMOUNT-MMO trial (NCT05556512), with results expected in late 2027.² Although SURMOUNT-MMO will assess the cardiovascular efficacy of tirzepatide in individuals without diabetes, evidence to inform treatment choices among available incretin-based therapies in clinical practice is urgently needed. Therefore, this study examines the comparative effectiveness of tirzepatide vs semaglutide among patients at cardiovascular risk with overweight or obesity but without diabetes in clinical practice.

Although many features of the target trial cannot be directly replicated in healthcare claims, key design features, including outcomes, exposures, and inclusion/exclusion criteria, were selected to proxy those features from the target trial. Randomization cannot be achieved in healthcare claims data but was proxied through a statistical balancing of measured covariates according to standard practice.

The database study will be a new-user active-comparative study, conducted using 3 national United States claims databases, where we compare the effect of tirzepatide vs semaglutide on the composite end point of all-cause mortality, myocardial infarction, or stroke. Clinical guidelines during the study period recommended both tirzepatide and semaglutide for similar indications.

The study will use three data sources: Optum Clinformatics, Merative MarketScan, and Medicare.

Optum: Eligible cohort entry period between May 13, 2022 to November 30, 2025.

MarketScan: Eligible cohort entry period between May 13, 2022 to September 30, 2023.

Medicare: Eligible cohort entry period between May 13, 2022 to September 30, 2024.

4. Rationale and background

The purpose of this protocol is to specify a target trial assessing the comparative effectiveness of the dual glucose-dependent insulinotropic polypeptide (GIP) and glucagon-like peptide-1 receptor agonist (GLP-1-RA) tirzepatide vs the injectable version of the GLP-1-RA semaglutide on major adverse cardiovascular outcomes (MACE), defined as the composite end point of all-cause mortality, myocardial infarction, or stroke among patients at cardiovascular risk with overweight or obesity but without diabetes treated in clinical practice. This study will also include a subgroup analysis of individuals meeting the eligibility criteria of the ongoing SURMOUNT-MMO trial, which is investigating the effect of tirzepatide vs placebo in patients with overweight but without diabetes.²

The GIP/GLP-1-RA tirzepatide became available on May 13, 2022, when it was approved to treat type 2 diabetes mellitus.³ A year later, on November 8, 2023 tirzepatide was approved for chronic weight management in adults with obesity or overweight who also have at least one weight-related comorbid condition, such as hypertension, dyslipidemia, type 2 diabetes mellitus, obstructive sleep apnea, or cardiovascular disease. Later on, on December 20, 2024, tirzepatide was approved to treat moderate to severe obstructive sleep apnea (OSA) in adults with obesity, to be used in combination with a reduced-calorie diet and increased physical activity.

Injectable semaglutide became available on December 5, 2017 under the brand name Ozempic.⁴ On January 16, 2020, the approval was expanded to include cardiovascular risk reduction in adults with type 2 diabetes mellitus and known heart disease. On March 28, 2022, Novo Nordisk received FDA approval for a higher-dose semaglutide (2 mg) to provide improved glycemic control for adults with type 2 diabetes mellitus. Meanwhile, semaglutide received its first FDA approval for the treatment of obesity in adults under the brand name Wegovy on June 4, 2021. On December 23, 2022, the approval was extended to include teenagers aged 12 and older. Later, on March 8, 2024, Wegovy was additionally approved for cardiovascular risk reduction in people with overweight or obesity and established cardiovascular disease. On January 28, 2025, Ozempic became the first and only GLP-1-RA approved to reduce the risk of worsening kidney disease and cardiovascular death in adults with Type 2 diabetes and chronic kidney disease.

Previous emulation studies have been benchmarked against reference RCTs evaluating clinically related questions on the cardiovascular benefits of tirzepatide and semaglutide, and have obtained results that closely replicated findings of the respective trials. These benchmarking studies have increased our understanding and confidence in the robustness of the design, data, and analytic approach. We will draw from this infrastructure, tailored to address the study question outlined in this protocol.

5. Research question and objectives

Table 2. Primary and secondary research questions and objectives

A. Primary research question and objective

Objective:	To evaluate the comparative effect of tirzepatide vs injectable semaglutide on the composite of all-cause mortality, myocardial infarction, or stroke among patients at cardiovascular risk with overweight or obesity but without diabetes treated in clinical practice.
------------	---

Hypothesis:	We hypothesize that tirzepatide will be noninferior to injectable semaglutide at preventing all-cause mortality, myocardial infarction, or stroke in patients at cardiovascular risk with overweight or obesity but without diabetes treated in clinical practice.
Population (mention key inclusion-exclusion criteria):	Individuals typically treated in clinical practice at cardiovascular risk with overweight or obesity but without diabetes.
Exposure:	Tirzepatide.
Comparator:	Injectable semaglutide.
Outcome:	Composite of all-cause mortality, myocardial infarction, or stroke.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.
Setting:	The outcome will be measured from inpatient hospitalizations and death.
Main measure of effect:	Hazard ratio.

B. Secondary research questions and objectives

Objective:	To evaluate the comparative effect of tirzepatide vs injectable semaglutide on the individual components of the primary endpoint, i.e., all-cause mortality, myocardial infarction, or stroke among patients at cardiovascular risk with overweight or obesity but without diabetes treated in clinical practice.
Hypothesis:	We hypothesize that tirzepatide will be noninferior to injectable semaglutide at preventing all-cause mortality, myocardial infarction, or stroke in patients at cardiovascular risk with overweight or obesity but without diabetes treated in clinical practice.
Population (mention key inclusion-exclusion criteria):	Individuals typically treated in clinical practice at cardiovascular risk with overweight or obesity but without diabetes.
Exposure:	Tirzepatide.
Comparator:	Injectable semaglutide.
Outcome:	Individual components of the primary endpoint, i.e., all-cause mortality, myocardial infarction, or stroke.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.
Setting:	The outcome will be measured from inpatient hospitalizations and death.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of tirzepatide vs injectable semaglutide on a composite event of myocardial infarction, stroke, hospitalization for unstable angina, coronary revascularization, or hospitalization for heart failure among patients at cardiovascular risk with overweight or obesity but without diabetes treated in clinical practice.
Hypothesis:	We hypothesize that tirzepatide will be noninferior to injectable semaglutide at preventing myocardial infarction, stroke, hospitalization for unstable angina, coronary revascularization, or hospitalization for heart failure in patients at cardiovascular risk with overweight or obesity but without diabetes treated in clinical practice.
Population (mention key inclusion-exclusion criteria):	Individuals typically treated in clinical practice at cardiovascular risk with overweight or obesity but without diabetes.
Exposure:	Tirzepatide.
Comparator:	Injectable semaglutide.
Outcome:	Composite of myocardial infarction, stroke, hospitalization for unstable angina, coronary revascularization, or hospitalization for heart failure
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.
Setting:	The outcome will be measured from inpatient hospitalizations.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of tirzepatide vs injectable semaglutide on the risk of hospitalizations for heart failure among patients at cardiovascular risk with overweight or obesity but without diabetes treated in clinical practice.
Hypothesis:	We hypothesize that tirzepatide will be noninferior to injectable semaglutide at preventing heart failure hospitalizations in patients at cardiovascular risk with overweight or obesity but without diabetes treated in clinical practice.
Population (mention key inclusion-exclusion criteria):	Individuals typically treated in clinical practice at cardiovascular risk with overweight or obesity but without diabetes.
Exposure:	Tirzepatide
Comparator:	Injectable semaglutide.
Outcome:	Hospitalization for heart failure.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.

Setting:	The outcome will be measured from inpatient hospitalizations.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of tirzepatide vs injectable semaglutide on the risk of hospitalizations for unstable angina among patients at cardiovascular risk with overweight or obesity but without diabetes treated in clinical practice.
Hypothesis:	We hypothesize that tirzepatide will be noninferior to injectable semaglutide at preventing hospitalizations for unstable angina in patients at cardiovascular risk with overweight or obesity but without diabetes treated in clinical practice.
Population (mention key inclusion-exclusion criteria):	Individuals typically treated in clinical practice at cardiovascular risk with overweight or obesity but without diabetes.
Exposure:	Tirzepatide.
Comparator:	Injectable semaglutide.
Outcome:	Hospitalization for unstable angina.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.
Setting:	The outcome will be measured from inpatient hospitalizations.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of tirzepatide vs injectable semaglutide on the risk of coronary revascularization among patients at cardiovascular risk with overweight or obesity but without diabetes treated in clinical practice.
Hypothesis:	We hypothesize that tirzepatide will be noninferior to injectable semaglutide at preventing coronary revascularization in patients at cardiovascular risk with overweight or obesity but without diabetes treated in clinical practice.
Population (mention key inclusion-exclusion criteria):	Individuals typically treated in clinical practice at cardiovascular risk with overweight or obesity but without diabetes.
Exposure:	Tirzepatide
Comparator:	Injectable semaglutide.
Outcome:	Coronary revascularization.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.

Setting:	The outcome will be measured from inpatient hospitalizations.
Main measure of effect:	Hazard ratio.

C. Safety research questions and objectives

Objective:	To evaluate the comparative effect of tirzepatide vs injectable semaglutide on the safety outcome of urinary tract infections among patients at cardiovascular risk with overweight or obesity but without diabetes treated in clinical practice.
Hypothesis:	We hypothesize that tirzepatide will not have a different effect from injectable semaglutide.
Population (mention key inclusion-exclusion criteria):	Individuals typically treated in clinical practice at cardiovascular risk with overweight or obesity but without diabetes.
Exposure:	Tirzepatide.
Comparator:	Injectable semaglutide.
Outcome:	Urinary tract infections.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.
Setting:	The outcome will be measured using diagnosis codes in an inpatient or outpatient setting that are followed by an antibiotic prescription within 7 days of the diagnosis code.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of tirzepatide vs injectable semaglutide on the safety outcome of serious infections among patients at cardiovascular risk with overweight or obesity but without diabetes treated in clinical practice.
Hypothesis:	We hypothesize that tirzepatide will not have a different effect from injectable semaglutide.
Population (mention key inclusion-exclusion criteria):	Individuals typically treated in clinical practice at cardiovascular risk with overweight or obesity but without diabetes.
Exposure:	Tirzepatide.
Comparator:	Injectable semaglutide.
Outcome:	Serious infections.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.
Setting:	The outcome will be measured using primary diagnosis codes in an inpatient setting.

Main measure of effect:	Hazard ratio.
Objective:	To evaluate the comparative effect of tirzepatide vs injectable semaglutide on the safety outcome of gastrointestinal adverse events among patients at cardiovascular risk with overweight or obesity but without diabetes treated in clinical practice.
Hypothesis:	We hypothesize that tirzepatide will not have a different effect from injectable semaglutide.
Population (mention key inclusion-exclusion criteria):	Individuals typically treated in clinical practice at cardiovascular risk with overweight or obesity but without diabetes.
Exposure:	Tirzepatide.
Comparator:	Injectable semaglutide.
Outcome:	Gastrointestinal adverse events.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.
Setting:	The outcome will be measured using diagnosis codes in an inpatient and outpatient setting.
Main measure of effect:	Hazard ratio.

D. Additional research questions and objectives

Objective:	To evaluate the effect of tirzepatide vs injectable semaglutide on negative control outcomes, (1) hernia and (2) lumbar radiculopathy among patients at cardiovascular risk with overweight or obesity but without diabetes treated in clinical practice.
Hypothesis:	We hypothesize that tirzepatide will not have a different effect from injectable semaglutide.
Population (mention key inclusion-exclusion criteria):	Individuals typically treated in clinical practice at cardiovascular risk with overweight or obesity but without diabetes. In addition, patients will be excluded with recent hernia or lumbar radiculopathy prior to the follow-up time window (30 days) when studying the negative outcome hernia or lumbar radiculopathy, respectively.
Exposure:	Tirzepatide.
Comparator:	Injectable semaglutide.
Outcome:	Separate analyses for hernia and lumbar radiculopathy.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.
Setting:	The outcome will be measured using diagnosis codes in an inpatient or outpatient setting.

Main measure of effect:	Hazard ratio.

6. Research methods

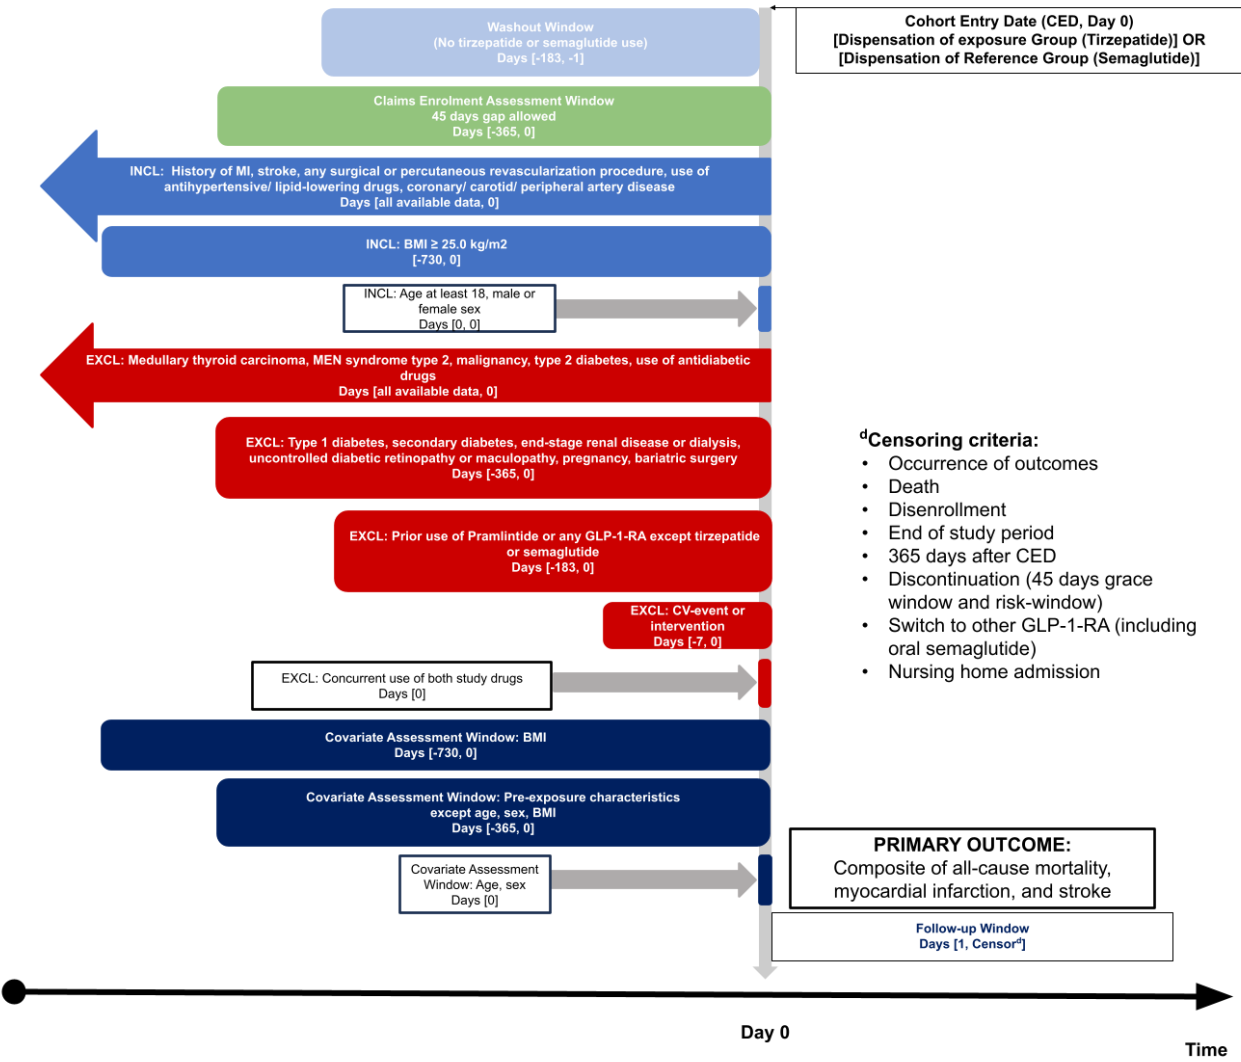

6.1 Study design

Research design (e.g. cohort, case-control, etc.): New user active-comparator cohort study.

Rationale for study design choice: The new user active-comparator design is a powerful design that may be able to address confounding by indication. It accomplishes this, in large part, through judicious selection of an appropriate active-comparator group.^{5,6} While selection of an appropriate comparator in the design phase is crucial, cohort studies often require additional adjustment of measurable confounders. A common method for adjusting for confounding is via a propensity score.

6.2 Study design diagram

Figure 1. Study diagram for the comparison tirzepatide vs semaglutide.

6.3 Setting

6.3.1 Context and rationale for definition of time 0 (and other primary time anchors) for entry to the study population

Time 0 in the database studies was defined to emulate randomization to tirzepatide vs semaglutide in the target trial design. See appendix tables 1 and 2a for operational definitions and detailed code algorithms.

6.3.2 Context and rationale for study inclusion criteria:

Study inclusion criteria were defined to reflect clinical routine care settings. See appendix tables 1 and 2 for operational definitions and detailed code algorithms. A flowchart of the study cohort assembly is provided in appendix 3.

6.3.3 Context and rationale for study exclusion criteria

Study exclusion criteria were defined to reflect clinical routine care settings. See appendix tables 1 and 2 for operational definitions and detailed code algorithms. A flowchart of the study cohort assembly is provided in appendix 3.

6.4 Variables

6.4.1 Context and rationale for exposure(s) of interest

The exposure and comparator were defined to emulate the agents compared for the target trial, tirzepatide vs semaglutide (active-comparator). See appendix tables 1 and 2 for operational definitions and detailed code algorithms.

Algorithm to define duration of exposure effect:

Assuming the effect of the drug lasts for 45 days after the last day's supply, we allow a 45 days gap between the dispensation (grace period) and also add 45 days at the end of the last day's supply (exposure risk window).

6.4.2 Context and rationale for outcome(s) of interest

The primary outcome for the database study was MACE, defined as a composite of all-cause mortality, stroke, or myocardial infarction in line with typical cardiovascular outcomes trials. See appendix tables 1 and 2 for operational definitions and detailed code algorithms. Optum includes death information from the inpatient discharged dead status, social security death master file, and deaths scraped from obituaries or other sources. MarketScan includes information from the inpatient discharged dead status as well as social security death master file. PPV for myocardial infarction using ICD9 codes was 94%.⁷⁻⁹ PPV for ischemic stroke using ICD9 codes was 95% and 99% using ICD10-CM codes.¹⁰ ICD9 codes for myocardial infarction were mapped to ICD10, but no validation study was performed.¹¹

Secondary outcomes from the target trial that will be evaluated include:

1. Individual components of the primary endpoint, i.e., all-cause mortality, myocardial infarction, or stroke.
2. Composite of myocardial infarction, stroke, hospitalization for unstable angina, coronary revascularization, or hospitalization for heart failure.
3. Hospitalization for heart failure.
4. Hospitalization for unstable angina.
5. Coronary revascularization.

Safety outcomes of interest include:

1. Urinary tract infections.
2. Serious infections.
3. Gastrointestinal adverse events.

Control outcomes of interest include:

1. Hernia (excluding patients with recent outcome prior to the follow-up time window). This is a negative control outcome where no difference in effect is expected for tirzepatide vs injectable semaglutide.
2. Lumbar radiculopathy (excluding patients with recent outcome prior to the follow-up time window). This is a negative control outcome where no difference in effect is expected for tirzepatide vs injectable semaglutide.

6.4.3 Context and rationale for follow-up

Both on-treatment (OT) and intention-to-treat (ITT) analyses will be conducted. Adherence in clinical practice databases is expected to be much worse than in a hypothetical trial, therefore the OT analysis will be the primary analysis. The OT analysis targets the relative hazard of outcomes while on treatment and may more closely emulate the effect observed in highly adherent trial participants. Both OT and ITT analyses will be conducted with up to 1-year follow-up.

Table 1. Operational Definitions of follow-up

follow-up start	Day 1	
follow-up end¹	Select all that apply	Specify
Date of outcome	Yes	
Date of death	Yes	Part of the primary outcome.
End of observation in data	Yes	Date of disenrollment.
Day X following index date (specify day)	Yes	Day 365.
End of study period (specify date)	Yes	Dates for different databases (Optum: February 28, 2026; MarketScan: December 31, 2023; Medicare: December 31, 2024)
End of exposure (specify operational details, e.g. stockpiling algorithm, grace period)	Yes	45 days grace window and 45 days risk window.
Date of add to/switch from exposure (specify algorithm)	Yes	Date of augmentation or switching from an exposure to a comparator and vice versa.
Other date (specify)	Yes	Censor upon nursing home admission or starting any other GLP-1-RA (including oral semaglutide).

¹ follow-up ends at the first occurrence of any of the selected criteria that end follow-up.

6.4.4 Context and rationale for covariates (confounding variables and effect modifiers, e.g. risk factors, comorbidities, comedications)

We identified a series of covariates that were likely confounders due to being strong risk factors for the primary outcome that were associated with choice of treatment. These include demographics, disease severity related variables, comorbid conditions, comedications, frailty, healthcare utilization and markers of health seeking behaviour.

6.5 Data analysis

6.5.1 Context and rationale for analysis plan

The studies will use a propensity score based overlap weighting method.¹² This approach was selected because it covariate balance while preserving patients, thereby maximizing power. The propensity score will be estimated as the probability of initiating injectable semaglutide, or tirzepatide given the baseline patient characteristics using multivariable logistic regression models. As diagnostics for PS models, the study will evaluate distributional overlap, weight distribution, and covariate balance using standardized differences post-weighting. The study will estimate the hazard ratio for injectable semaglutide vs tirzepatide on MACE outcome in the weighted population using a Cox proportional hazards model with robust standard errors. Effect estimates obtained across databases will be summarized using fixed-effects models for meta-analysis

Table 3. Primary, secondary, and subgroup analysis specification

A. Primary research question and objective

Hypothesis:	Tirzepatide vs injectable semaglutide does not increase the risk of a composite of death, myocardial infarction, or stroke among patients at cardiovascular risk with overweight or obesity but without diabetes treated in clinical practice.
Exposure contrast:	Tirzepatide vs injectable semaglutide.
Outcome:	Composite of all-cause mortality, myocardial infarction, or stroke.
Analytic software:	Aetion, SAS 9.4, R.4.4.0, Python 3.13.3
Model(s): (provide details or code)	Outcome model: Cox proportional hazards Follow-up time * status(0) = exposure
Confounding adjustment method	Name method and provide relevant details, e.g. bivariate, multivariable, propensity score weighting (specify weighting algorithm ratio and caliper), propensity score weighting (specify weight formula, trimming, truncation), propensity score stratification (specify strata definition), other.
	Overlap weighting based on the propensity score.
Missing data methods	Name method and provide relevant details, e.g. missing indicators, complete case, last value carried forward, multiple imputation (specify model/variables), other.
	Assumption that if no relevant claims diagnoses/procedures are present, the condition is not present.
Subgroup Analyses	List all subgroups
	Age (<65 vs ≥65 years), sex (male vs female), race (white, black), BMI (<35 vs ≥35 kg/m ²), ASCVD (yes vs no), heart failure (yes vs no), CKD (CKD1-2 vs CKD3-4), prior myocardial infarction or stroke (yes vs no), atrial fibrillation (yes vs no), frailty status (non-frail, pre-frail, frail), concomitant SGLT2 inhibitor use (yes vs no), concomitant loop diuretic use (yes vs no), individuals meeting SURMOUNT-MMO trial eligibility criteria.

B. Secondary research questions and objectives

Hypothesis:	Tirzepatide vs injectable semaglutide does not increase the risk of occurrence of the individual components of the primary endpoint, i.e., all-cause mortality, myocardial infarction, or stroke among patients at cardiovascular risk with overweight or obesity but without diabetes treated in clinical practice.
Exposure contrast:	Tirzepatide vs injectable semaglutide.
Outcome:	Individual components of the primary endpoint, i.e., all-cause mortality, myocardial infarction, or stroke.
Analytic software:	Aetion, SAS 9.4, R.4.4.0, Python 3.13.3
Model(s): (provide details or code)	Outcome model: Cox proportional hazards for all-cause mortality, Aalen-Johansen estimator for myocardial infarction and stroke to account for the competing risk of death.

Table 4. Sensitivity analyses – rationale, strengths and limitations

	What is being varied? How?	Why? (What do you expect to learn?)	Strengths of the sensitivity analysis compared to the primary	Limitations of the sensitivity analysis compared to the primary
Negative control outcomes, including hernia and lumbar radiculopathy	We evaluate negative control outcomes of hernia and lumbar radiculopathy, where no causal effect is expected from tirzepatide, or injectable semaglutide.	We will evaluate the potential impact of residual confounding on this outcome for which there is not expected to be a causal effect	The evaluates the robustness of the interpretation of the primary analysis by evaluating the potential magnitude of unmeasured confounding	This analysis assumes that the confounding structure is the same or similar for the negative control outcome as the outcome of interest
As-started analyses (observational analogue to intention-to-treat) to address potential informative censoring.	To address potential informative censoring.	We will consider the first-used medication for 365 days without considering drug discontinuation or switching, mimicking an “intention-to-treat” approach.	Reflects follow-up regimen of RCT.	Persistence of drug use is shorter in clinical practice whereas adherence is typically higher in RCTs. Therefore, we expect the estimated effects will be diluted toward the null, underestimating the true treatment effect had patients remained on therapy.
2-year on-treatment analysis	We will follow the patients for up to 2 years on-treatment.	To examine potential changes in the comparative effectiveness beyond the 1-year on-treatment analysis.	Examines potential changes of effectiveness beyond the 1-year follow-up in the primary analysis.	Very few patients in clinical practice remain on treatment beyond one year. Consequently, the small number of individuals still at risk during extended follow-up represents a selected subset of patients, which may

introduce bias. Moreover, the sparse data in this later period mean that outcomes among a few remaining participants can have a disproportionate effect on the Kaplan–Meier estimates.

6.6 Data sources

6.6.1 Context and rationale for data sources

Reason for selection: The study will be conducted in 3 US health care claims databases: Optum Clinformatics (2022-2026), Merative MarketScan (2022-2023), and Medicare (2022-2024). **Strengths of data source(s):** Each data source contains deidentified, longitudinal, date-stamped information on patient enrollment, demographics, inpatient/outpatient diagnosis and procedures, admission and discharge dates, and medication dispensation. The death data is captured in the Optum database from inpatient discharge status, social security death master file, and deaths scraped from obituaries or other sources. The death data in MarketScan is captured from the social security death master file and inpatient discharge status. It is recognized that the social security death master file has high specificity and positive predictive value for deaths. While this data resource has under captured deaths since 2011, the capture of deaths is not expected to be differential between compared exposure groups. The death data is captured in the Medicare database from inpatient discharge status, and social security death master file.¹³⁻¹⁵

Limitations of data source(s): Patient healthcare encounters are only observable when they are enrolled in an insurance plan that contributes to the database. Patients may change insurance plans for multiple reasons. Both Optum Clinformatics and Merative MarketScan are primarily employer based insurance databases where patients may disenroll with job changes. In claims data, dispensing data for inpatient medication is unavailable. Diagnoses reflect billing practices, therefore algorithms (preferably validated) are needed for accurate phenotyping of patient conditions. Services that are not covered by insurance do not appear in the data. The trial evaluated cardiovascular deaths, however we will evaluate all-cause mortality in the emulation because most deaths in this cohort of patients at high cardiovascular risk will likely be attributed to cardiovascular reasons, the cause of death is not recorded for databases not linked to NDI, and the performance of NDI at identifying cardiovascular causes of death may be suboptimal.¹⁵ The completeness of death ascertainment differs across the three databases. Optum captures deaths from multiple sources, including inpatient discharge status, the Social Security Death Master File, and obituary-based sources, whereas Medicare includes death information from inpatient discharge records, the Social Security Death Master File, and National Death Index linkages. In contrast, death ascertainment in MarketScan is more limited and is primarily based on inpatient discharge status, resulting in undercapture of deaths occurring outside the hospital setting. Although this limitation may reduce the sensitivity of mortality ascertainment, it is not expected to differ systematically between treatment groups and therefore is unlikely to introduce substantial differential bias in comparative effect estimates.

Data source provenance/curation:

Information about Optum Clinformatics and Merative MarketScan can be found in data dictionaries and user guides that are provided to clients.

6.7 Data management

Tracking data: The Data Use Agreement (DUA) Custodian (Principal Investigator) and the Division Operations Manager (Winta Tekle) are responsible for receiving and creating a record of new data associated with the given request. The Operations Manager is responsible for all indexing and archiving of documents and electronic media related to data that the Division receives and will log data location, data contents, and associated DUA and Institutional Review Board (IRB) numbers in the Division's centralized tracking system.

Handling and storage: In-scope data will be stored utilizing Mass General Brigham approved information systems – i.e., Division servers and Mass General Brigham network storage.

Archiving: Data retention and any removal will be executed by the Division Operations Manager (Winta Tekle) and Data Manager (Todd MacGarvey). The Division follows Mass General Brigham enterprise record retention policies and follow the terms of the agreement through which the in-scope data was received.

Information security: The Division follows Mass General Brigham's Enterprise Information Security Program (EISP). The EISP helps by providing assurance that Mass General Brigham information and information systems are protected from unauthorized access, use, disclosure, duplication, modification, or destruction in order to maintain their confidentiality, integrity, and availability. To that end, the EISP policies, standards and procedures create an information security framework that is aligned with the recommendations of the International Organization for Standardization's (ISO) publication 27001 and the National Institute of Standards and Technology's (NIST) publication 800-53 Family of Controls and MGB regulatory and legal requirements (as a HIPAA covered entity).

Mass General Brigham workforce members are required to complete new workforce privacy and information security training upon hire and annually thereafter. Refresh training is provided as appropriate. Mass General Brigham workforce members are required to review and sign a Confidentiality Agreement upon hire and annually thereafter. Additionally, we follow Enterprise Information Security and Privacy policies, including Managing Workforce Members Information Security Responsibilities Policy, which was developed to help assure that Mass General Brigham workforce members are competent and eligible to support the information security responsibilities associated with their role. Mass General Brigham workforce, including Division staff, are required to comply with Enterprise Information Security and Privacy Policies.

Facilities: The research team uses a highly secure, state-of-the-art, computing facility housed at Mass General Brigham's Corporate Data Centers in Needham and Marlborough, Massachusetts as well as Amazon Web Services (AWS). We maintain redundant storage for maximal data integrity and high-speed data access.

The Division uses Mass General Brigham corporate provisioned servers to analyze and store data in connection with this project. There are strict access controls enforced by technical means to ensure that only study staff who have been approved to conduct data analyses and contracted data engineers are able to access data (e.g., Mass General Brigham Authentication (Active Directory) utilized; auditing, logging, and monitoring enabled; firewalls enabled; etc.). All Division servers used in this study are accessible to only authorized staff only through the MGB network and utilizing VPN as appropriate (i.e., users must be on the network and logged into VPN to access). Mass General Brigham has a network information security monitoring team and in-scope servers are enrolled in enterprise security tools (e.g., vulnerability scanning service, antivirus, etc.).

The Division also uses AWS. In-scope AWS services / resources have undergone review and assessment by Mass General Brigham's Information Security Risk Assessment Team/ InfoSec Risk Management Team as required and in alignment with NIST 800-30: Guide for Conducting Risk Assessments. In-scope AWS servers are for our exclusive use (reserved instances), are covered under our organization's Business Associate Agreement with AWS. In-scope servers are housed in anonymous facilities that are not branded as AWS facilities. Physical access is strictly controlled both at the perimeter and at building ingress points by professional security staff utilizing video surveillance, intrusion detection systems, and other electronic means.

Security attributes and controls for the Division's use of in-scope AWS in connection with this project include: encryption at rest and in transit (industry standard AES-256 encryption, SSL/TSL), anti-malware, latest OS updates and patches as well as anti-virus; multi-factor authentication (MFA), Identity and Access Management, including SSO; auditing and logging; principle of least privilege, including for traffic and ports (e.g., deny all default

configurations), use of VPC enabled Step functions, etc.; separation between environments; minimum necessary (out of the box AWS roles are not used as they can be overly permissive); all data would reside in the US domestic regions – use only US east HIPAA compliant region; performance monitoring enabled and reviewed as per internal processes; passwords compliant with enterprise password policy and, as appropriate, more protective password requirements; etc. Our Division's AWS use is also subject to ongoing evaluation and monitoring as well – e.g., vulnerability scanning and management, access review, etc.

A data file list will be maintained in Amazon S3 and tracked through Cloudtrail and Cloudwatch. Reporting of data file availability for any file stored in an S3 bucket will be controlled by MGB.

Amazon EC2, Amazon EBS, and Amazon VPC are integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in Amazon EC2, Amazon EBS, and Amazon VPC. CloudTrail captures all API calls for Amazon EC2, Amazon EBS, and Amazon VPC as events, including calls from the console and from code calls to the APIs. MGB IT/security staff have full access to CloudTrail to ensure that CloudTrail monitoring is available at all times. Amazon CloudWatch Events delivers a near-real-time stream of system events that describe changes in AWS resources. Amazon CloudTrail can log, continuously monitor, and retain account activity related to actions across the MGB AWS infrastructure. CloudTrail provides event history of MGB AWS account activity. This event history simplifies security analysis, resource change tracking, and troubleshooting and complies with requirements to ensure the data file inventory is controlled by MGB.

Backups: Backups are created using industry recognized Cryptographic mechanisms (e.g., 256-bit AES encryption) as appropriate and required. Data are backed up within the MGB network from the MGB Needham data center to the MGB Marlborough data center via replication/mirroring and volume-level snapshots. AWS Backup supports both instance-level backups as Amazon Machine Images (AMIs) and volume-level backups as separate snapshots based on the resource tags. AMIs allow MGB IT and security staff to create backups of all S3 and EC2 instances.

In addition to the safeguards listed above, the Division follows enterprise privacy and information security policies and maintains internally procedures in connection with this project to safeguard the data in connection with this project as appropriate and required including: Physical Security and Environmental Controls for Electronic Information Policy; IT Access Control Standards for Users policy; Safeguarding Fax Copiers Printers Telephone Use and Pagers; Physical Removal and Transport of Protected Health Information and Personal Information policy, etc.

6.8 Quality control

Senior Programmers and Research Specialists perform QA/QC on raw or common data model converted data via SAS/R/Aetion software. The protocol will be iteratively developed and pre-specified data checks including feasibility counts and balance on baseline covariates will be conducted with outputs reviewed by MGB team members. Team members will review code lists to ensure fidelity to intended algorithms.

6.9 Study size and feasibility

See appendix 4 and appendix 5 (feasibility, weighting on age, sex, comorbidity score as well as all predefined propensity score variables). Propensity score distribution plots with c-statistics are available in appendix 6. Table 1 showing prevalence of baseline characteristics and standardized

differences in distribution are available in appendix 7. Additional diagnostic evaluations, including balance assessments of laboratory and clinical examination test results not included in the propensity score will be conducted to assess potential residual confounding and divergence of treatment over time.

7. Limitation of the methods

As we are using secondary data and the data were not collected for research purposes, some important variables may not be collected or will be measured imperfectly. We have selected validated algorithms when possible and we have created proxies for important variables that are not directly captured in the data to reduce confounding by unmeasured factors.

8. Protection of human subjects

This study has been approved by the Brigham and Women's Hospital Institutional Review Board.

Algorithm detail: Adherence in clinical practice databases is expected to be much worse than in the trial, therefore the on-treatment analysis at 1 year follow-up will be the primary analysis.

Algorithm detail: If BMI measurement via LOINC code is below 10 or above 100 then measurement is set to missing.

Outcome											
	1 All-cause mortality		N/A	Bias Implications of Outcome Misclassification in Observational Studies Evaluating Association Between Treatments and All-Cause or Cardiovascular Mortality Using Administrative Claims Kyota Y, Schneeweiss S, Glynn RJ, Cannuscio CC, Avorn J, Solomon DH. Accuracy of medicare claims-based diagnosis of acute myocardial infarction: estimating positive predictive value on the basis of review of hospital records. Am Heart J. 2004;148(1):99-104. doi:10.1016/j.ahj.2004.02.013	N/A						
	2 Acute myocardial infarction		ICD-9-CM	Validity of Myocardial Infarction Diagnoses in Administrative Databases: A Systematic Review Specificity and NPV were available only from three studies and in these ranged from 89–99%, and 75–99% Performance of ICD-10-CM Diagnostic Codes for Identifying Acute Ischemic Stroke in a National Health Insurance Claims Database: Derivation and Validation of ICD-10 Codes for Identifying Incident Stroke Validity of Diagnostic Codes for Acute Stroke in Administrative Databases: A Systematic Review	Validation study	94%	410.x				
	3 Non-fatal stroke		ICD-10-CM	The PPV specifically for acute stroke was ≤ 68%. In at least 50% of studies, PPVs were ≥ 93% for subarachnoid haemorrhage (ICD-9 430/ICD-10 I60), 89% for intracerebral haemorrhage (ICD-9 431/ICD-10 I61), and 82% for ischaemic stroke (ICD-9 434/ICD-10 I63 or ICD-9 434&436)	Validation study	99%	430 431 433 434 436	410.x	No		
				The sensitivity of ICD-9 430-438/ICD-10 I60-I69 for any cerebrovascular disease was ≥ 82% in most (≥ 50%) studies, and specificity and NPV were both ≥ 95%.			430 431 433 434 436

In order to complete the initial power analysis, a dummy outcome of a 90-day gap in database enrollment was used. This outcome is used to ensure that no information on the comparative risks of the outcomes of interest are available at this stage. We completed a PS overlap weighted comparative analysis using this outcome. The PS included only 3 covariates: age, sex, and combined comorbidity index. Power calculations are based on the formulas from Chow et al. (2008).
