2. Abstract

This is a non-randomized, non-interventional study that is part of the *Randomized Controlled Trials Duplicated Using Prospective Longitudinal Insurance Claims: Applying Techniques of Epidemiology* (RCT-DUPLICATE) initiative (www.rctduplicate.org) of the Brigham and Women's Hospital, Harvard Medical School. It is intended to assess the comparative effectiveness of oral semaglutide vs sitagliptin as a placebo proxy using a target trial emulation framework. The SOUL trial (NCT03914326) and its database emulation study (NCT06659718) demonstrated a reduction in atherosclerotic cardiovascular events with oral semaglutide among patients with type 2 diabetes and high cardiovascular risk. The STEP-HF-EF DM trial (NCT04916470) and its database emulation study (NCT06914102) found the injectable formulation of semaglutide to lower the risk for heart failure hospitalization in patients with cardiometabolic HFpEF, and its non-inferiority to tirzepatide (NCT06914141). However, the effectiveness of oral semaglutide in reducing the risk of heart failure events remains unclear.

The comparative effectiveness target trial described below draws from eligibility criteria from the STEP-HFpEF DM trial but is designed to include a much larger and more diverse group of patients than the trial allowed. Although many features of the target trial cannot be directly replicated in healthcare claims, measurements of key design features, including outcomes, exposures, and inclusion/exclusion criteria, were designed to proxy those features from the target trial. Randomization cannot be achieved in healthcare claims data but was proxied through a statistical balancing of measured covariates according to standard practice.

The database study will be a new-user active-comparative study, conducted using 3 national United States claims databases, where we compare the effect of oral semaglutide vs sitagliptin on heart failure outcomes.

The study will use three data sources: Optum Clinformatics, Merative Marketscan, and Medicare.

Optum: Eligible cohort entry period from September 20, 2019 to November 30, 2025.
Marketscan: Eligible cohort entry from September 20, 2019 to December 31, 2023.
Medicare: Eligible cohort entry from September 20, 2019 to December 31, 2020.

3. Amendments and updates

Version date	Version number	Section of protocol	Amendment or update	Reason

Jan 24, 2026	1			
May 20, 2026	2	6.5.1	Add additional subgroups of interest: Individuals with HFpEF who meet the eligibility criteria of the SOUL trial. In addition, we will explore additinal subgroups stratified by race (white, black), BMI (<35 vs ≥35 kg/m²), ASCVD status (yes vs no), valve disorders (yes vs no), atrial fibrillation (yes vs no), CKD (CKD1-2 vs CKD3-4), frailty status (non-frail, pre-frail, frail), prior heart failure hospitalization (yes vs no), prior myocardial infarction or stroke (yes vs no), and concomitant loop diuretic use (yes vs no).	After registration of the initial version of this protocol, a subgroup analysis of the SOUL trial involving 991 participants with HFpEF suggested a reduction in hospitalization for heart failure, urgent heart failure visits, or cardiovascular death. To critically assess the design, data, and analytic setup of our database study, we will emulate the subgroup of participants with HFpEF in the SOUL trial. We will evaluate concordance between the estimates from our database study (hospitalization for heart failure, urgent care visit, or all-cause mortality) and the subgroup trial estimates (hospitalization for heart failure, urgent care visit, or cardiovascular mortality) using RCT-DUPLICATE agreement metrics. Further, we will investigate heterogeneity of treatment effects by focusing on numbers needed to treat and effect estimates in clinically important subgroups.

4. Rationale and background

The purpose of this protocol is to specify the target trial evaluating the effectiveness of the oral formulation of the glucagon-like peptide-1 receptor agonist (GLP-1-RA) semaglutide versus the dipeptidyl peptidase-4 inhibitors (DPP4i) sitagliptin on heart failure outcomes in patients with type 2 diabetes. Clinical guidelines during the study period recommended both drug classes under investigation as second- or third-line options for glucose lowering and the compared drug classes were similarly costly.

Oral semaglutide 7mg or 14mg (as Rybelsus) received FDA approval for the treatment of type 2 diabetes in September, 2019.[1] On October 17, 2025, the approval was expanded to include cardiovascular risk reduction in adults with type 2 diabetes, with or without a prior CV event or not.[2] Most recently, on December 22, 2025, oral semaglutide 25mg (as Wegovy) was approved for weight management.[3]

Sitagliptin was specifically chosen as an active comparator that could proxy for placebo because a major randomized controlled trial on cardiovascular outcomes demonstrated that it does not affect the cardiovascular outcomes under investigation.[5] This contrasts with other DPP4i such as saxagliptin, which has raised concerns regarding potential increased risks of heart failure, [6–9] and linagliptin, which is commonly prescribed for patients with renal impairment because it does not require dose modifications based on kidney function, potentially leading to increased confounding compared to sitagliptin.[10,11] Sodium-glucose Cotransporter-2 (SGLT2) inhibitors would not be a neutral comparator, as they significantly reduce clinically important kidney events, kidney failure, and cardiovascular events.[12–15] Sulfonylureas (SUs), though inexpensive and widely used, are a poor comparator in cardiovascular outcome studies due to their association with hypoglycemia, weight gain, and channeling bias, as they are often prescribed to elderly, lower socioeconomic status patients with higher baseline cardiovascular risk, making direct comparisons to GLP-1-RAs less reliable.[16]

Previous emulation studies have been benchmarked against reference RCTs evaluating clinically related questions on the cardiovascular benefits of injectable and oral semaglutide, and have obtained results that closely replicated findings of the trials. These benchmarking studies have increased our understanding and confidence in the robustness of the design, data, and analytic approach. We will reuse the same design, data, and analytics infrastructure, tailored to address the study question outlined in this protocol. In alignment with our previous work and major heart failure outcomes trials such as STEP-HFpEF DM and SUMMIT, we consider the event of worsening heart failure events with and without all cause mortality as a co-primary end point. All-cause mortality will be interpreted with caution as an end point in this study, as a previous emulation of the SUSTAIN-6 cardiovascular outcomes trial showed divergent results for mortality that were suggestive of residual confounding, informing the development of the current protocol.

5. Research question and objectives

Table 2. Primary and secondary research questions and objectives

A. Co-primary research questions and objectives

Objective:	To evaluate the comparative effect of oral semaglutide vs sitagliptin on the composite of worsening heart failure events or all-cause mortality in patients with heart failure with preserved ejection fraction in clinical practice.
Hypothesis:	We hypothesize that oral semaglutide will be superior to sitagliptin in individuals with heart failure with preserved ejection fraction at preventing heart failure hospitalization.
Population (mention key inclusion-exclusion criteria):	Individuals aged 18 years or older with heart failure with preserved ejection fraction.
Exposure:	Oral semaglutide.
Comparator:	Sitagliptin.
Outcome:	Composite of worsening heart failure event (exacerbated symptoms of heart failure resulting in hospitalization, intravenous diuretic therapy in an urgent care setting) or all-cause mortality.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, or start of any other GLP-1-RA including injectable semaglutide.
Setting:	The outcomes will be measured from inpatient hospitalizations, intravenous diuretic therapy in an outpatient setting, and death index.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of oral semaglutide vs sitagliptin on worsening heart failure events with heart failure with preserved ejection fraction in clinical practice.
Hypothesis:	We hypothesize that oral semaglutide will be superior to sitagliptin in individuals with heart failure with preserved ejection fraction at preventing all-cause mortality or worsening heart failure events.
Population (mention key inclusion-exclusion criteria):	Individuals aged 18 years or older with heart failure with preserved ejection fraction.
Exposure:	Oral semaglutide.
Comparator:	Sitagliptin.
Outcome:	Worsening heart failure event (exacerbated symptoms of heart failure resulting in hospitalization, intravenous diuretic therapy in an urgent care setting).
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, or start of any other GLP-1-RA including injectable semaglutide.

Setting:	The outcome will be measured from inpatient hospitalizations, intravenous diuretic therapy in an outpatient setting.
Main measure of effect:	Hazard ratio.

B. Secondary research questions and objectives

Objective:	To evaluate the comparative effect of oral semaglutide vs sitagliptin on heart failure hospitalization in patients with heart failure with preserved ejection fraction in clinical practice.
Hypothesis:	We hypothesize that oral semaglutide will be superior to sitagliptin in individuals with heart failure with preserved ejection fraction at preventing heart failure hospitalization.
Population (mention key inclusion-exclusion criteria):	Individuals aged 18 years or older with heart failure with preserved ejection fraction.
Exposure:	Oral semaglutide.
Comparator:	Sitagliptin.
Outcome:	Heart failure hospitalization.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, or start of any other GLP-1-RA including injectable semaglutide.
Setting:	The outcomes will be measured from inpatient hospitalizations.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of oral semaglutide vs sitagliptin on worsening heart failure events in patients with heart failure with preserved ejection fraction in clinical practice.
Hypothesis:	We hypothesize that oral semaglutide will be superior to sitagliptin in individuals with heart failure with preserved ejection fraction at preventing heart failure hospitalization.
Population (mention key inclusion-exclusion criteria):	Individuals aged 18 years or older with heart failure with preserved ejection fraction.
Exposure:	Oral semaglutide.
Comparator:	Sitagliptin.
Outcome:	Worsening heart failure event requiring intravenous diuretic therapy in an urgent care setting.

Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, or start of any other GLP-1-RA including injectable semaglutide.
Setting:	The outcomes will be measured from intravenous diuretic therapy in an outpatient setting.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of oral semaglutide vs sitagliptin on the safety outcome of urinary tract infections in clinical practice.
Hypothesis:	We hypothesize that oral semaglutide will not have a different effect from sitagliptin.
Population (mention key inclusion-exclusion criteria):	Individuals aged 18 years or older with heart failure with preserved ejection fraction.
Exposure:	Oral semaglutide.
Comparator:	Sitagliptin.
Outcome:	Urinary tract infections.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, or start of any other GLP-1-RA including injectable semaglutide.
Setting:	The outcome will be measured using diagnosis codes in an inpatient or outpatient setting that are followed by an antibiotic prescription within 7 days of the diagnosis code.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of oral semaglutide vs sitagliptin on the safety outcome of serious infections in clinical practice.
Hypothesis:	We hypothesize that oral semaglutide will not have a different effect from sitagliptin.
Population (mention key inclusion-exclusion criteria):	Individuals aged 18 years or older with heart failure with preserved ejection fraction.
Exposure:	Oral semaglutide.
Comparator:	Sitagliptin.
Outcome:	Serious infections.

Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, or start of any other GLP-1-RA including injectable semaglutide.
Setting:	The outcome will be measured using primary diagnosis codes in an inpatient setting.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of Oral semaglutide vs sitagliptin on the safety outcome of gastrointestinal adverse events in clinical practice.
Hypothesis:	We hypothesize that oral semaglutide will have more events compared to sitagliptin.
Population (mention key inclusion-exclusion criteria):	Individuals aged 18 years or older with heart failure with preserved ejection fraction.
Exposure:	Oral semaglutide.
Comparator:	Sitagliptin.
Outcome:	Gastrointestinal adverse events.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, or start of any other GLP-1-RA including injectable semaglutide.
Setting:	The outcome will be measured using diagnosis codes in an inpatient and outpatient setting.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the effect of oral semaglutide vs sitagliptin on a negative control outcome of hernia in clinical practice.
Hypothesis:	We hypothesize that oral semaglutide will not have a different effect from sitagliptin.
Population (mention key inclusion-exclusion criteria):	Individuals aged 18 years or older with heart failure with preserved ejection fraction.
Exposure:	Oral semaglutide.
Comparator:	Sitagliptin.

Outcome:	Hernia (excluding patients with recent outcome prior to the follow-up time window (30 days)).
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, or start of any other GLP-1-RA including injectable semaglutide.
Setting:	The outcome will be measured using diagnosis codes in an inpatient or outpatient setting.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the effect of oral semaglutide vs sitagliptin on a negative control outcome of lumbar radiculopathy in clinical practice.
Hypothesis:	We hypothesize that oral semaglutide will not have a different effect from sitagliptin.
Population (mention key inclusion-exclusion criteria):	Individuals aged 18 years or older with heart failure with preserved ejection fraction.
Exposure:	Oral semaglutide.
Comparator:	Sitagliptin.
Outcome:	Lumbar radiculopathy (excluding patients with recent outcome prior to the follow-up time window (30 days)).
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, or start of any other GLP-1-RA including injectable semaglutide.
Setting:	The outcome will be measured using diagnosis codes in an inpatient or outpatient setting.
Main measure of effect:	Hazard ratio.

6. Research methods

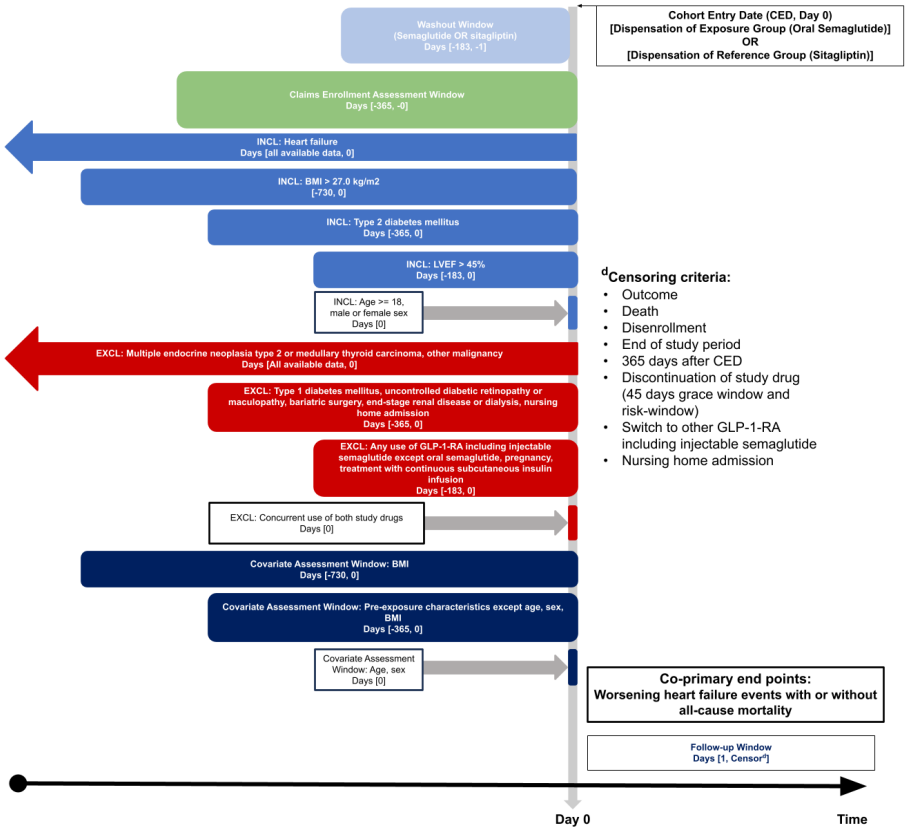
6.1 Study design

Research design (e.g. cohort, case-control, etc.): New user active-comparator cohort study.

Rationale for study design choice: The new user active-comparator design is a powerful design that may be able to address confounding by indication. It accomplishes this, in large part, through judicious selection of an appropriate active-comparator group.[17,18] While selection of an appropriate comparator in the design phase is crucial, cohort studies often require additional adjustment of measurable confounders. A common method for adjusting for confounding is via a propensity score.

6.2 Study design diagrams (Figure 1).

Figure 1. Exposure-based cohort entry where the cohort entry date is selected after application of exclusion criteria



6.3 Setting

6.3.1 Context and rationale for definition of time 0 (and other primary time anchors) for entry to the study population

Time 0 in the database study was defined to emulate randomization to oral semaglutide or sitagliptin in the target trial design. See appendix tables 1a and 2a for operational definitions and detailed code algorithms.

6.3.2 Context and rationale for study inclusion criteria:

Study inclusion criteria were defined to reflect clinical routine care settings. See appendix tables 1 and 2 for operational definitions and detailed code algorithms. A flowchart of the study cohort assembly is provided in appendices 3.

6.3.3 Context and rationale for study exclusion criteria

Study exclusion criteria were defined to reflect clinical routine care settings. See appendix tables 1 and 2 for operational definitions and detailed code algorithms. A flowchart of the study cohort assembly is provided in appendices 3.

6.4 Variables

6.4.1 Context and rationale for exposure(s) of interest

The exposure and comparator were defined to emulate the agents compared for the target trial, oral semaglutide vs sitagliptin (active-comparator placebo proxy). See appendix tables 1 and 2 for operational definitions and detailed code algorithms.

Algorithm to define duration of exposure effect:

Assuming the effect of the drug lasts for 45 days after the last day's supply, we allow a 45 days gap between the dispensation (grace period) and also add 45 days at the end of the last day's supply (exposure risk window).

6.4.2 Context and rationale for outcome(s) of interest

The primary outcome for the database study was defined to reflect typical heart failure outcomes trials. See appendix tables 1 and 2d for operational definitions and detailed code algorithms. Optum includes death information from the inpatient discharged dead status, social security death master file, and deaths scraped from obituaries or other sources. MarketScan includes information from the inpatient discharged dead status up until 2016. Medicare includes information from the inpatient discharged dead status, NDI cause of death, and social security death master file. PPV for heart failure diagnosis using ICD9 codes was 87% and for HHF 98%.[19,20]

Secondary outcomes from the trial that will be explored – recognizing they will be underpowered – to understand what drives the effect estimates of the primary end point include:

1. Hospitalization for heart failure.
2. Worsening heart failure event requiring intravenous diuretic therapy in an urgent care setting.

Safety outcomes of interest include:

1. Urinary tract infections.
2. Serious infections.
3. Gastrointestinal adverse events.

Control outcomes of interest include:

1. Hernia (excluding patients with recent outcome prior to the follow-up time window). This is a negative control outcome where no difference in effect is expected for oral semaglutide vs sitagliptin.
2. Lumbar radiculopathy (excluding patients with recent outcome prior to the follow-up time window). This is a negative control outcome where no difference in effect is expected for oral semaglutide vs sitagliptin.

6.4.3 Context and rationale for follow-up

Both on-treatment (OT) and intention-to-treat (ITT) analyses will be conducted. Adherence in clinical practice databases is expected to be much worse than in a trial, therefore the OT analysis will be the primary analysis. The OT analysis targets the relative hazard of outcomes while on treatment and may more closely emulate the effect observed in highly adherent trial participants. Both OT and ITT will be conducted at 1-year follow-up and compared to the hazard ratio of cumulative incidence rates observed in the trial.

Table 1. Operational Definitions of follow-up

follow-up start	Day 1

follow-up end[1]	Select all that apply	Specify
Date of outcome	Yes	
Date of death	Yes	Part of the primary outcome.
End of observation in data	Yes	Date of disenrollment.
Day X following index date (specify day)	Yes	Day 365.
End of study period (specify date)	Yes	Different dates for different databases (Optum: November 31, 2025; Marketscan: December 31, 2023; Medicare: December 31, 2020).
End of exposure (specify operational details, e.g. stockpiling algorithm, grace period)	Yes	45 days grace window and 45 days risk window.
Date of add to/switch from exposure (specify algorithm)	Yes	Date of augmentation or switching from an exposure to a comparator and vice versa.
Other date (specify)	Yes	Censor upon starting any other GLP-1-RA.

[1] follow-up ends at the first occurrence of any of the selected criteria that end follow-up.

6.4.4 Context and rationale for covariates (confounding variables and effect modifiers, e.g. risk factors, comorbidities, comedications)

We identified a series of covariates that were likely confounders due to being strong risk factors for the primary outcome that were associated with choice of treatment. These include demographics, disease severity related variables, comorbid conditions, comedications, frailty, healthcare utilization and markers of health seeking behaviour.

6.5 Data analysis

6.5.1 Context and rationale for analysis plan

The study will use a propensity score based overlap weighting method.[21] The propensity score will be estimated as the probability of initiating semaglutide vs sitagliptin given the baseline patient characteristics using multivariable logistic regression models. As diagnostics for propensity score models, the study will evaluate distributional overlap, weight distribution, and covariate balance using standardized differences post-weighting. The study will estimate the hazard ratio for semaglutide vs sitagliptin on the composite all-cause mortality or heart failure hospitalization in the weighted population using a Cox proportional hazards model with robust standard errors.

Table 3. Primary, secondary, and subgroup analyses specification

A. Co-primary analyses

Hypothesis:	Oral semaglutide decreases the risk of the composite of worsening heart failure events or all-cause mortality in individuals with heart failure with preserved ejection fraction in clinical practice.
Exposure contrast:	Oral semaglutide vs sitagliptin.
Outcome:	The composite of worsening heart failure events or all-cause mortality.
Analytic software:	Aetion, SAS 9.4, R.4.4.0
Model(s): **(provide details or code)**	Outcome model: Cox proportional hazards Follow-up time * status(0) = exposure
Confounding adjustment method	**Name method and provide relevant details, e.g. bivariate, multivariable, propensity score weighting (specify weighting algorithm ratio and caliper), propensity score weighting (specify weight formula, trimming, truncation), propensity score stratification (specify strata definition), other.**
	Overlap weighting based on the propensity score.
Missing data methods	**Name method and provide relevant details, e.g. missing indicators, complete case, last value carried forward, multiple imputation (specify model/variables), other.**
	Assumption that if no relevant claims diagnoses/procedures are present, the condition is not present.
Subgroup Analyses	**List all subgroups**
	Exploratory subgroup analyses, focusing on number needed to treat and confidence intervals, include individuals of age (<70 vs 70 years), sex (male vs female), race (white, black), BMI (<35 vs ≥35 kg/m^2), ASCVD (yes vs no), valve disorders (yes vs no), atrial fibrillation (yes vs no), CKD (CKD1-2 vs CKD3-4), frailty status (non-frail, pre-frail, frail), prior heart failure hospitalization (yes vs no), prior myocardial infarction or stroke (yes vs no), concomitant SGLT2 inhibitor use (yes vs no), concomitant loop diuretic use (yes vs no), concomitant insulin use (yes vs no), individuals meeting eligibility criteria of the STEP-HFpEF DM trial, individuals with HFpEF meeting eligibility criteria of the SOUL trial.

Hypothesis:	Oral semaglutide decreases the risk of worsening heart failure events in individuals with heart failure with preserved ejection fraction in clinical practice.
Exposure contrast:	Oral semaglutide vs sitagliptin.
Outcome:	Worsening heart failure event (exacerbated symptoms of heart failure resulting in hospitalization, intravenous diuretic therapy in an urgent care setting).

Broader definition of end point hospitalization for heart failure.	Instead of requiring an inpatient discharge diagnosis in the primary position for heart failure, we will allow an inpatient diagnosis in any position for heart failure.	Helps determine whether restricting to primary-position heart failure diagnoses omits relevant cases or whether including secondary diagnoses introduces misclassification.	Increases sensitivity for capturing hospitalizations for heart failure.	Some hospitalizations may primarily be for other conditions rather than heart failure itself.
Intention-to-treat analyses to address potential informative censoring.	To address potential informative censoring.	We will consider the first-used medication for 365 days without considering drug discontinuation or switching, mimicking an "intention-to-treat" approach.	Reflects follow-up regimen of RCT.	Persistence of drug use is shorter in clinical practice whereas adherence is typically higher in RCTs. Therefore, we expect the estimated effects will be diluted toward the null, underestimating the true treatment effect had patients remained on therapy.

6.6 Data sources

6.6.1 Context and rationale for data sources

Reason for selection: The study will be conducted in 3 US health care claims databases: Optum Clinformatics (2019-2025), Merative Marketscan (2019-2023), and Medicare (a sample that includes all patients with diabetes with heart failure diagnosis, 2019-2020).

Strengths of data source(s): Each data source contains deidentified, longitudinal, date-stamped information on patient enrollment, demographics, inpatient/outpatient diagnosis and procedures, admission and discharge dates, and medication dispensation. The death data is captured in the Optum database from inpatient discharge status, social security death master file, and deaths scraped from obituaries or other sources. The death data in

MarketScan is captured from the social security death master file and inpatient discharge status. It is recognized that the social security death master file has high specificity and positive predictive value for deaths. While this data resource has under captured deaths since 2011, the capture of deaths is not expected to be differential between compared exposure groups.

Limitations of data source(s): Patient healthcare encounters are only observable when they are enrolled in an insurance plan that contributes to the database. Patients may change insurance plans for multiple reasons. Both Optum Clinformatics and Merative MarketScan are primarily employer based insurance databases where patients may disenroll with job changes. Patients in Medicare may move in and out of fee-for-service plans. We are excluding person-time in health maintenance organization (HMO) plans due to concerns about the completeness of capture of diagnoses and procedures. This means that we require patients to be enrolled in Medicare parts AB and D during the baseline assessment window and censor patients if they switch to part C. In claims data, dispensing data for inpatient medication is unavailable. Diagnoses reflect billing practices, therefore algorithms (preferably validated) are needed for accurate phenotyping of patient conditions. Services that are not covered by insurance do not appear in the data. We will evaluate all-cause mortality in the emulation because most deaths in this cohort of patients at high cardiovascular risk will be related to cardiovascular reasons, the cause of death is not recorded for databases not linked to NDI, and the performance of NDI at identifying cardiovascular causes of death may be suboptimal.[22]

Data source provenance/curation:

Information about Optum Clinformatics and Merative MarketScan can be found in data dictionaries and user guides that are provided to clients. Information about Medicare data provenance and curation can be found on the ResDac website. [23]

6.7 Data management

Tracking data: The Data Use Agreement (DUA) Custodian (Principal Investigator) and the Division Operations Manager (Winta Tekle) are responsible for receiving and creating a record of new data associated with the given request. The Operations Manager is responsible for all indexing and archiving of documents and electronic media related to data that the Division receives and will log data location, data contents, and associated DUA and Institutional Review Board (IRB) numbers in the Division's centralized tracking system.

Handling and storage: In-scope data will be stored utilizing Mass General Brigham approved information systems – i.e., Division servers and Mass General Brigham network storage.

Archiving: Data retention and any removal will be executed by the Division Operations Manager (Winta Tekle) and Data Manager (Todd MacGarvey). The Division follows Mass General Brigham enterprise record retention policies and follow the terms of the agreement through which the in-scope data was received.

Information security: The Division follows Mass General Brigham's Enterprise Information Security Program (EISP). The EISP helps by providing assurance that Mass General Brigham information and information systems are protected from unauthorized access, use, disclosure, duplication, modification, or destruction in order to maintain their confidentiality, integrity, and availability. To that end, the EISP policies, standards and procedures create an information security framework that is aligned with the recommendations of the International Organization for Standardization's (ISO) publication 27001 and the National Institute of Standards and Technology's (NIST) publication 800-53 Family of Controls and MGB regulatory and legal requirements (as a HIPAA covered entity).

Mass General Brigham workforce members are required to complete new workforce privacy and information security training upon hire and annually thereafter. Refresh training is provided as appropriate. Mass General Brigham workforce members are required to review and sign a Confidentiality Agreement upon hire and annually thereafter. Additionally, we follow Enterprise Information Security and Privacy policies, including Managing Workforce Members Information Security Responsibilities Policy, which was developed to help assure that Mass General Brigham workforce members

are competent and eligible to support the information security responsibilities associated with their role. Mass General Brigham workforce, including Division staff, are required to comply with Enterprise Information Security and Privacy Policies.

Facilities: The research team uses a highly secure, state-of-the-art, computing facility housed at Mass General Brigham's Corporate Data Centers in Needham and Marlborough, Massachusetts as well as Amazon Web Services (AWS). We maintain redundant storage for maximal data integrity and high-speed data access.

The Division uses Mass General Brigham corporate provisioned servers to analyze and store data in connection with this project. There are strict access controls enforced by technical means to ensure that only study staff who have been approved to conduct data analyses and contracted data engineers are able to access data (e.g., Mass General Brigham Authentication (Active Directory) utilized; auditing, logging, and monitoring enabled; firewalls enabled; etc.). All Division servers used in this study are accessible to only authorized staff only through the MGB network and utilizing VPN as appropriate (i.e., users must be on the network and logged into VPN to access). Mass General Brigham has a network information security monitoring team and in-scope servers are enrolled in enterprise security tools (e.g., vulnerability scanning service, antivirus, etc.).

The Division also uses AWS. In-scope AWS services / resources have undergone review and assessment by Mass General Brigham's Information Security Risk Assessment Team/ InfoSec Risk Management Team as required and in alignment with NIST 800-30: Guide for Conducting Risk Assessments. In-scope AWS servers are for our exclusive use (reserved instances), are covered under our organization's Business Associate Agreement with AWS. In-scope servers are housed in anonymous facilities that are not branded as AWS facilities. Physical access is strictly controlled both at the perimeter and at building ingress points by professional security staff utilizing video surveillance, intrusion detection systems, and other electronic means.

Security attributes and controls for the Division's use of in-scope AWS in connection with this project include: encryption at rest and in transit (industry standard AES-256 encryption, SSL/TSL), anti-malware, latest OS updates and patches as well as anti-virus; multi-factor authentication (MFA), Identity and Access Management, including SSO; auditing and logging; principle of least privilege, including for traffic and ports (e.g., deny all default configurations), use of VPC enabled Step functions, etc.; separation between environments; minimum necessary (out of the box AWS roles are not used as they can be overly permissive); all data would reside in the US domestic regions – use only US east HIPAA compliant region; performance monitoring enabled and reviewed as per internal processes; passwords compliant with enterprise password policy and, as appropriate, more protective password requirements; etc. Our Division's AWS use is also subject to ongoing evaluation and monitoring as well – e.g., vulnerability scanning and management, access review, etc.

A data file list will be maintained in Amazon S3 and tracked through Cloudtrail and Cloudwatch. Reporting of data file availability for any file stored in an S3 bucket will be controlled by MGB.

Amazon EC2, Amazon EBS, and Amazon VPC are integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in Amazon EC2, Amazon EBS, and Amazon VPC. CloudTrail captures all API calls for Amazon EC2, Amazon EBS, and Amazon VPC as events, including calls from the console and from code calls to the APIs. MGB IT/security staff have full access to CloudTrail to ensure that CloudTrail monitoring is available at all times. Amazon CloudWatch Events delivers a near-real-time stream of system events that describe changes in AWS

resources. Amazon CloudTrail can log, continuously monitor, and retain account activity related to actions across the MGB AWS infrastructure. CloudTrail provides event history of MGB AWS account activity. This event history simplifies security analysis, resource change tracking, and troubleshooting and complies with requirements to ensure the data file inventory is controlled by MGB.

Backups: Backups are created using industry recognized Cryptographic mechanisms (e.g., 256-bit AES encryption) as appropriate and required. Data are backed up within the MGB network from the MGB Needham data center to the MGB Marlborough data center via replication/mirroring and volume-level snapshots. AWS Backup supports both instance-level backups as Amazon Machine Images (AMIs) and volume-level backups as separate snapshots based on the resource tags. AMIs allow MGB IT and security staff to create backups of all S3 and EC2 instances. This backup approach allows elimination of EC2 instances when access to CMS data files is no longer needed. Use of temporary instances will allow highest security control to be applied regarding for whom and when CMS data files are accessible.

In addition to the safeguards listed above, the Division follows enterprise privacy and information security policies and maintains internally procedures in connection with this project to safeguard the data in connection with this project as appropriate and required including: Physical Security and Environmental Controls for Electronic Information Policy; IT Access Control Standards for Users policy; Safeguarding Fax Copiers Printers Telephone Use and Pagers; Physical Removal and Transport of Protected Health Information and Personal Information policy, etc.

6.8 Quality control

Senior Programmers and Research Specialists perform QA/QC on raw or common data model converted data via SAS/R/Aetion software. The protocol will be iteratively developed and pre-specified data checks including feasibility counts and balance on baseline covariates will be conducted with outputs reviewed by MGB team members. Team members will review code lists to ensure fidelity to intended algorithms.

6.9 Study size and feasibility

See appendices 4 and appendices 5 (feasibility, weighting on age, sex, comorbidity score as well as all predefined propensity score variables). Propensity score distribution plots with c-statistics are available in appendices 6. Tables 1 showing prevalence of baseline characteristics and standardized differences in distribution are available in appendices 7. Additional diagnostic evaluations, including balance assessments of laboratory and clinical examination test results not included in the propensity score as well as assessment of heart failure-related medication after follow-up, will be conducted to assess potential residual confounding and divergence of treatment over time.

7. Limitation of the methods

As we are using secondary data and the data were not collected for research purposes, some important variables may not be collected or will be measured imperfectly. We have selected validated algorithms when possible and we have created proxies for important variables that are not directly captured in the data to reduce confounding by unmeasured factors. One measurement difference is, for example, an inclusion criterion requiring left ventricular ejection fraction (LVEF). Since these measurements are not captured in claims, we proxied LVEF by applying a predictive algorithm for LVEF with high positive predictive value (PPV) of 91%. This has been a frequently used method in other database studies.[24,25]

8. Protection of human subjects

This study has been approved by the Brigham and Women's Hospital Institutional Review Board.

Medicare fee-for-service: information on mortality was available through the vital status file
Optum Clinformatics: information on mortality was available through four sources: Centers for Medicare and Medicaid Services, Social Security Administration Master Death Files, in-hospital deaths, and death as a reason for insurance discontinuation
IBM MarketScan: information on mortality was limited to in-hospital deaths.

In order to complete the initial power analysis, a dummy outcome of a 90-day gap in database enrollment was used. This outcome is used to ensure that no information on the comparative risks of the outcomes of interest are available at this stage. We completed a PS overlap weighted comparative analysis using this outcome. The PS included only 3 covariates: age, sex, and combined comorbidity index. Power calculations are based on the formulas from Chow et al. (2008).
