## CLINICAL STUDY PROTOCOL

**Title:** A double-blind, randomized, placebo-controlled study to assess the safety and efficacy of nebulized PC945 when added to systemic antifungal therapy for the treatment of refractory invasive pulmonary aspergillosis (OPERA-T Study)

**Short Title:** Safety and efficacy of PC945 in combination with other antifungal therapy for the treatment of refractory invasive pulmonary aspergillosis

**Protocol Number:** PC\_ASP\_006

**Original Protocol Date:** 14 September 2021

**Amendment 1** 16 March 2022

**Amendment 2** 21 February 2024

**Amendment 3** 10 June 2024

**Amendment 4** 30 October 2024

**Amendment 5** 29 September 2025

**IND number:** 146173

**NCT number:** NCT05238116

**EudraCT number:** (former application number prior to CTR transition) 2021-004554-32

**EU CT number:** 2024-511281-36

**Phase:** 3

**Compound Identifier:** PC945

**Sponsor:** Pulmocide Ltd.  
44 Southampton Buildings  
London, WC2A 1AP

<b>Company</b>
Pulmocide Ltd.

The information contained in this document is the property of Pulmocide Limited and may not be produced, published or disclosed to others without written authorization from Pulmocide Limited. This study will be conducted in compliance with Good Clinical Practice and applicable regulatory requirements including the European Union Clinical Trials Regulation 536/2014 from the moment of transition to its framework.

## PROTOCOL SUMMARY

### Rationale

The low systemic bioavailability and high degree of lung penetration and retention of nebulized PC945 could make it a suitable antifungal agent to be used in combination with systemic antifungal therapy for the treatment of invasive pulmonary aspergillosis (IPA) in order to improve treatment success rates without increasing the safety risk. The main objective of this study is therefore to assess the efficacy, safety and tolerability of PC945 when administered in combination with systemic antifungal therapy for the treatment of refractory IPA.

### Objectives

#### Primary Objective

To assess the efficacy of nebulized PC945 in combination with systemic antifungal therapy for the treatment of refractory IPA

#### Secondary Objective

To assess the safety and tolerability of nebulized PC945 in combination with systemic antifungal therapy for the treatment of refractory IPA

CCCCCCCCCCCC

### Primary Efficacy Outcome

Day 84 favorable overall response: being alive and having a complete or partial overall response at Day 84, as assessed by the Data Review Committee (DRC)

### Secondary Efficacy Outcomes

- Favorable overall response: having a favorable response at any time during the 84-day (12-week) treatment phase. This endpoint will be based upon observing a complete or partial response at any time during the 84-day (12-week) treatment phase where the survival component is not included as part of the response definition

<b>Study Number: PC_ASP_006</b>	<b>Compound No.: PC945</b>
Protocol	Amendment 5

- Time to favorable overall response: the time from randomization to the first favorable overall response at any time during the 84-day (12-week) treatment phase
- All-cause mortality

### **Safety and Tolerability Outcomes**

The safety and tolerability outcomes, which will be detailed in the Statistical Analysis Plan, will include, but will not be limited to, the following:

- Adverse events, changes in vital signs, laboratory data, and electrocardiograms (ECGs)

Study Number: PC_ASP_006	Compound No.: PC945
Protocol	Amendment 5

## Study Design

This Phase 3, double-blind, randomized, placebo-controlled, parallel-group, multi-center, international study will assess the efficacy, safety, and tolerability of nebulized PC945 when added to systemic antifungal therapy for the treatment of refractory IPA.

## Exclusion Criteria

Potential study subjects must satisfy none of the Exclusion Criteria to be eligible to enter the study.

<b>Study Number: PC_ASP_006</b> Protocol	Compound No.: PC945 Amendment 5
---	------------------------------------

15. Subject with a known or suspected concomitant medical condition or post-surgery complication that, in the opinion of the Investigator, may jeopardize adherence to the protocol requirements or impede the accurate measurement of efficacy or may be an unacceptable additional risk to the subject should he/she participate in the study
16. Subject who has previously received PC945
17. Subject with a known history of allergy, hypersensitivity, or any previous serious reaction to any component of the PC945 or placebo formulations
18. Subject who has recently received, is receiving or due to receive at any time during the study, an investigational medicinal agent that does not have any regulatory-approved indications. Subjects who are participating in any other trials e.g., Observational, diagnostic or using medications with an approved indication may be allowed to participate after consultation with the sponsor on an individual basis
19. [Removed]

## 1. INTRODUCTION

### 1.1. Background

The incidence of fungal infections and diseases has increased substantially over the past two decades and invasive forms are a leading cause of morbidity and mortality, especially among immune-suppressed patients. Aspergillosis (infection caused by the *Aspergillus* species of fungi) results in a range of disorders either directly from the infection, or by triggering an allergic response. *Aspergillus* can infect a variety of organs, though the respiratory system is the site most commonly involved.

Fungal spores are ubiquitous in the environment and the small size of *Aspergillus* spores facilitates inhalation and deposition in the distal airways [Fairs, 2012; Pasupneti, 2017]. In healthy individuals the spores are cleared by a combination of mucociliary action and phagocytosis by macrophages and neutrophils. However, in patients with impaired mucociliary function, retained mucus or compromised airways, inhaled spores can persist and spread within the airways [Takazono, 2017]. Corticosteroids or immunosuppressant therapies may also be a risk factor for aspergillosis if they impair macrophage and/or neutrophil function. The temperature and moist environment in the airways provide ideal conditions for germination and the establishment of infection [Takazono, 2017].

Invasive aspergillosis (IA) occurs in 4% of patients undergoing remission induction chemotherapy for hematological malignancies, in 9% allogeneic hematological stem cell transplant recipients [Van de Peppel, 2018] and in 2-8% of lung transplant recipients [Samanta, 2020; Baker, 2020; Ullmann, 2018], despite the use of antifungal prophylaxis in these patient groups. The incidence is lower in other solid organ transplant recipients such as those who have received hepatic, cardiac, pancreatic or renal transplants [Ullmann, 2018]. Invasive aspergillosis also occurs in patients treated with prolonged high dose corticosteroids, or other immunosuppressant, those with chronic obstructive pulmonary disease, lung cancer, hepatic cirrhosis or critically ill patients requiring admission to intensive care following influenza or of the coronavirus disease (COVID-19) infections [Ullmann, 2018; Verweij, 2020; Williams, 2007; Thompson, 2020].

*Aspergillus* is a particularly important opportunistic infection in lung transplant recipients [Pasupneti, 2017; Husain, 2019]. Post-transplant immunosuppressive therapy facilitates progression of infection by impairing the required immune response to prevent tissue invasive disease. *Aspergillus* colonization or infection occurs post-lung transplant in approximately 30-50% of patients [Solé, 2005; Husain, 2016], but is more common in patients transplanted for cystic fibrosis, who are often colonized with the organism pre-transplant [Husain, 2016; Nunley, 2002]. Tissue-invasive infection occurs in the first-year post-transplant in 2-8% of patients [Samanta, 2020; Baker, 2020; Ullmann, 2018]. In the first 3 months post-transplant this presents as infection at the bronchial anastomotic site or as a more widespread tracheobronchitis which may result in tracheal stenosis, necrosis, rupture of the anastomosis, bronchial abscess or pneumothorax [Pasupneti, 2017];

<b>Study Number: PC_ASP_006</b>	Compound No.: PC945
Protocol	Amendment 5

[Nunley, 2002](#)]. *Aspergillus* pneumonia can occur at any time post-transplant. *Aspergillus* colonization is also associated with an increased risk of bronchiolitis obliterans syndrome.

### 1.3. Potential Risks and Benefits to Human Subjects

The safety pharmacology and toxicology observations generated from the preclinical studies of PC945 indicate that the risks associated with its administration at the proposed clinical doses are likely to be minimal. Following inhaled delivery, PC945 plasma concentrations are hundreds to thousands fold lower than concentrations targeted for treatment or prophylaxis with systemically administered azoles.

CCICCI

Given that no safety alerts have been identified at the time of protocol finalization, no stopping criteria for PC945 are specified in this protocol. If any safety-related issues arise and in the opinion of the Investigator further dosing could put the subject at risk, subjects may be withdrawn from dosing. The Investigator may discuss any issues with the Sponsor before withdrawing a subject from dosing provided that this does not delay any medical decisions, in particular, in the event of an emergency situation.

The potency of PC945 against a range of *Aspergillus* species, which is the fungal organism most commonly associated with post lung transplant colonization and invasive pulmonary disease, has been demonstrated. The clinical dose selected for this study is expected to exceed the MIC<sub>90</sub> for the most common *Aspergillus* strains. In addition to receiving nebulized PC945 or matching placebo, all subjects will also be treated with background

<b>Study Number: PC_ASP_006</b>	Compound No.: PC945
Protocol	Amendment 5

SOC antifungal therapy which may be adjusted by the Investigator based on the clinical response of the subject. Therefore, no subject will go untreated in this study.

## **2. OBJECTIVES**

### **2.1. Primary Objective**

To assess the efficacy of nebulized PC945 in combination with systemic antifungal therapy for the treatment of refractory IPA.

### **2.2. Safety Objective**

To assess the safety and tolerability of nebulized PC945 in combination with systemic antifungal therapy for the treatment of refractory IPA.

## **3. ENDPOINTS**

### **3.1. Primary Efficacy Outcome**

Day 84 favorable overall response: being alive and having a complete or partial overall response at Day 84, as assessed by the DRC.

### **3.2. Secondary Efficacy Outcomes**

- Favorable overall response: having a favorable response at any time during the 84-day (12-week) treatment phase. This endpoint will be based upon observing a complete or partial response at any time during the 84-day (12-week) treatment phase where the survival component is not included as part of the response definition.
- Time to favorable overall response: the time from randomization to the first favorable overall response at any time during the 84-day (12-week) treatment phase

<b>Study Number: PC_ASP_006</b>	Compound No.: PC945
Protocol	Amendment 5

- All-cause mortality

### 3.3. Exploratory Efficacy Outcomes

CCICCI

### 3.4. Safety and Tolerability Outcomes

The safety and tolerability outcomes, which will be detailed in the Statistical Analysis Plan, will include, but will not be limited to, the following:

- Adverse events, changes in vital signs, laboratory data, and ECGs

---	------------------------------------

the Medical Monitor. Once the decision to unblind a subject's treatment assignment has been made the designated study site personnel may break the treatment code for that subject by accessing the Web-based response system via password-protected access. The reason for breaking the code must be recorded in the subject's source documents.

#### **4.1.3. Duration of Subject Participation**

The total duration of subject participation from Day 1 (day of first dose of study drug) will be 112 days (16 weeks) divided into two periods: the Treatment Phase will last 84 days (12 weeks) from randomization and the Safety Follow-up Phase will last 28 days (4 weeks) from Day 84 to Day 112. The Day 112 visit is the last visit in the study.

### **4.2. Stopping Rules**

#### **4.2.1. Study Stopping Rules**

Since no significant or known safety risks have been identified for nebulized PC945 based on the available preclinical and clinical safety data, no pre-specified safety stopping rules have been defined for this study. However, the safety of the subjects will be monitored on an ongoing basis in a blinded manner by the Investigator and the safety data will be reviewed regularly in a blinded manner by the Sponsor's and Clinical Research Organization's (CRO's) designated Medical Monitor(s). In addition, unblinded safety reviews will be performed by the DSMB. Refer to [Section 10](#) for more information on subject withdrawal.

The study will be stopped at any time if an unfavorable risk-benefit assessment is reached based on an ongoing assessment of data from new nonclinical studies, from ongoing clinical studies, and from adverse drug reaction reports received from the Specials Program. A variety of reasons may lead either the Sponsor or a regulatory agency to terminate the study early, in which case all subjects would be withdrawn from the study.

#### **4.2.2. Rules for Withdrawal of Subjects from the Study**

The study has no stopping rules that will require withdrawing individual subjects from the study. Please refer to [Section 10.2](#) for the Subject Withdrawal Criteria.

## **5. STUDY POPULATION**

The eligibility criteria for enrolling subjects in this study are provided in [Sections 5.1, 5.2, and 5.3](#). If there is any query relating to the inclusion or exclusion criteria described in these sections, the Investigator will discuss these with the Sponsor medical representative before enrolling a subject in the study. All subjects enrolled in the study must fully satisfy all eligibility criteria.

### 5.3. Exclusion criteria

Potential study subjects must satisfy none of the Exclusion Criteria to be eligible to enter the study.

**Study Number: PC\_ASP\_006**  
Protocol

Compound No.: PC945  
Amendment 5

15. Subject with a known or suspected concomitant medical condition or post-surgery complication that, in the opinion of the Investigator, may jeopardize adherence to the protocol requirements or impede the accurate measurement of efficacy or may be an unacceptable additional risk to the subject should he/she participate in the study
16. Subject who has previously received PC945
17. Subject with a known history of allergy, hypersensitivity, or any previous serious reaction to any component of the PC945 or placebo formulations
18. Subject who has recently received, is receiving or due to receive at any time during the study, an investigational medicinal agent that does not have any regulatory-approved indications. Subjects who are participating in any other trials e.g., Observational, diagnostic or using medications with an approved indication may be allowed to participate after consultation with the sponsor on an individual basis

## 6.1. Screening

The subject will be given the patient information to read and asked to sign the informed consent form (ICF). No study-specific assessments may be performed prior to the subject signing the study ICF.

Once informed consent has been obtained, the following screening information must be collected prior to randomization:

Study Number: PC\_ASP\_006

<b>Study Number: PC_ASP_006</b> Protocol	Compound No.: PC945 Amendment 5
---	------------------------------------

The Early Termination Visit is only required for subjects who completely withdraw consent for participation in the study and in such cases this visit should be conducted on the day of withdrawal or as soon as possible after the last dose of the blinded study medication. The Early Termination Visit is not appropriate for subjects who discontinue the blinded study medication, or decline specific assessments but otherwise continue in the study (including for safety follow-up).

## 6.5. Phone Contacts (Days 7, 21, 35, 49, 63, and 77)

Phone visits will be conducted at Days 7, 21, 35, 49, 63, and 77 with visit windows of +/- 3 days. If the subject is hospitalized, these visits may be performed at the bedside and by reviewing the subject charts.

At these study visits, the following information will be collected from the subject or from the subject's charts and will be recorded in the eCRF:

## 6.6. Day 112 Safety Follow-up Visit

A Safety Follow-up Visit will be conducted at Day 112. A visit window of +7 days is permitted.

At the Day 112 Visit, the following procedures will be performed:

Study Number: PC\_ASP\_006  
Protocol

Compound No.: PC945  
Amendment 5

CCl  
CCl  
CCl  
CCl

Safety procedures will be conducted according to the Table of Events Schedule (Appendix 16.1).

All AEs (refer to [Section 11.1](#) for definition of AEs) observed during the study must be recorded as such in the subject eCRF and reported to the Sponsor on the SAE Reporting Form (refer to [Section 11.2](#) for recording and reporting procedures).

### 6.8.1. Vital Signs

The following vital signs will be recorded at the Baseline/Day 1 visit (pre-first dose of study drug) and at the Day 14, Day 28, Day 42, Day 56, Day 70, Day 84/Early Termination, and Day 112 Safety Follow-Up Visits:

#### 6.9.6. Data Capture on Rescue Antifungal Treatment

Data on any rescue antifungal medication initiated for the treatment of fungal disease will be recorded in the eCRF and provided to the DRC. Rescue antifungal medication is defined as either the switching of the SOC antifungal agent(s) to a new agent or the addition of another SOC antifungal agent.

#### 6.9.7. Data Capture on Mortality

Data on mortality (date and cause of death) including autopsy information where available and status of underlying disease will be collected in the eCRF and provided to the DRC. A vital records search will be conducted for all subjects with incomplete survival data at Day 84.

#### 6.9.8. Data Review Committee

A blinded independent DRC, the members of which will not serve as Investigators on the study, will adjudicate the following:

- Confirmation of proven or probable IPA at randomization [retrospectively, for the purpose of statistical analyses and not for study qualification])
- Confirmation of refractoriness at Baseline/Day 1 (day of first dose of study drug [retrospectively, for the purpose of statistical analyses and not for study qualification])
- Overall response to treatment with study medication and SOC antifungal therapy at Day 42, at Day 84, and at the safety follow-up Day 112 visit using available clinical, mycological, and radiological data
- Assessment of the mycological response
- Occurrence of relapse of IPA at any time in the study (including weeks 12-16) in subjects with a DRC-confirmed favorable overall response during the 12-week treatment phase

Additional details will be provided in the DRC Charter.

#### 6.10. Pharmacokinetic Procedures

The following samples will be collected for PC945 PK analyses in all subjects (refer to the Laboratory Manual for more details on the volume of blood needed for these samples):

Study Number: PC\_ASP\_006  
Protocol

Compound No.: PC945  
Amendment 5

<b>Study Number: PC_ASP_006</b>	Compound No.: PC945
Protocol	Amendment 5

### 6.11. Health Care Resource Utilization Data

Health care resource utilization information for the duration of the subject's participation in the study will be collected from the subject's chart and will be recorded in the eCRF at the final visit (i.e., either at the Day 112 or at the Early Termination Visit). These data may be used for future healthcare resource utilization and pharmaco-economic analyses. If these analyses are conducted, the data will be summarized in a separate report outside of the Clinical Study Report. In addition to the information collected on bronchoscopies and radiological procedures (for example chest CT scan), the following information regarding hospitalizations will be collected:

- Date of admission, date of discharge and reason for each hospital admission (including the hospitalization for a transplant procedure prior to enrollment)
- Number and duration of, and reason for, ICU admissions

Study Number: PC_ASP_006 Protocol	Compound No.: PC945 Amendment 5
--------------------------------------	------------------------------------

- Number of, and reason for, bronchoscopies
- Number of, and reason for, CT chest scans (excluding the HRCT/regular CT scans required by the protocol)
- Use of rescue antifungal medication (reason for use and name and duration for each medication)
- Duration of parenteral antifungal treatment

## 7. LIFESTYLE AND/OR DIETARY RESTRICTIONS

The protocol does not require any specific lifestyle or dietary restrictions.

## 8. STUDY MEDICATION AND STANDARD OF CARE REFERENCE MEDICATION

### 8.1. Description of Study Medication

The Sponsor will be responsible for the supply of the IP/placebo for this study. A description of the study medication is provided in [Table 6](#).

**Table 6 Physical Description of IP and Placebo**

CCI

Dose adjustments of study medication will only be permitted for a suspected drug-related AE or poor tolerability (refer to the Pharmacy Manual). If the dose of study medication needs to be reduced for any of these reasons, the frequency of the dose should be reduced

If adjustment to the original dose is being considered, please discuss with the study Medical Monitor.

<b>Study Number: PC_ASP_006</b>	Compound No.: PC945
Protocol	Amendment 5

## 8.6. Handling and Storage

The Investigator's unblinded designee will verify and acknowledge receipt of the blinded investigational product. All study medication must be stored in a secure area with access limited to the Investigator's authorized unblinded site staff. Investigational product must be stored under appropriate conditions in accordance with the information provided in the Pharmacy Manual and on the label. Further information on the handling and storage requirements of the study medication is provided in the Pharmacy Manual.

No subject other than those enrolled in this study shall take study medication designated for this clinical trial. Study medication may not be utilized for any laboratory or animal research.

Study Number: PC_ASP_006 Protocol	Compound No.: PC945 Amendment 5
--------------------------------------	------------------------------------

## 8.9. Assessment of Compliance

Compliance will be assessed for all subjects to confirm that the subject is taking study medication according to the protocol instructions. Compliance will be assessed at each phone contact and in-person visit following the Baseline/Day 1 Visit (day of first dose of study drug) and will be recorded in the eCRF. All subjects will be given a subject diary to record the dates and times that study medication were taken, and if SOC mold-active medication for IPA treatment were taken or if any doses were missed and the reason for missing the dose.

For study medication, compliance will be assessed by the designated site staff considering all available information including subject diary, quantity of dispensed and returned used **CCICCCICI** based on the study medication dose and duration of treatment.

Accountability of the used **CCICCCICCCICCI** must only be performed by the designated unblinded site staff. For subjects admitted to hospital, compliance of study medication will be assessed by reviewing the dispensing/administration information in the subject's charts (date of administration, time of administration, and dose taken).

For the SOC antifungal IPA treatment, compliance will be assessed by reviewing the subject diaries and by enquiring if any doses were missed by the subject and the reason for the missed dose(s). For subjects admitted to hospital, compliance will be assessed by reviewing the dispensing/administration information in the subject's charts (medication name, date of administration, and dose).

## 8.10. Treatment of Overdose of Study Medication

The Investigator is responsible for ensuring that subjects only receive the protocol-stipulated dose of study medication. If a subject receives a dose of study medication greater than the dose specified in the protocol for a single administration or greater than the dose specified for a 24-hour period, this must be reported to the Sponsor and recorded in the eCRF.

Subjects exposed to higher than proposed study medication doses should be observed and supported appropriately and managed using the clinical judgment of the Investigator.

Please refer to [Section 11.3.3](#) for information on the considerations for expedited reporting following an overdose of study medication.

## 8.11. Occupational Safety

There are no specific occupational safety precautions for PC945.

Study Number: PC_ASP_006 Protocol	Compound No.: PC945
	Amendment 5

throughout the study and until 30 days after the last dose of study medication or of SOC mold-active treatment. The reliability of sexual abstinence needs to be evaluated in relation to the duration of the clinical trial and the preferred and usual lifestyle of the subject); OR

- Combined oral, vaginal ring or patch contraceptives, taken as directed for at least 30 days prior to screening; OR
- Contraceptive implant (Norplant®) implanted at least 90 days prior to screening; OR
- Injectable contraception (e.g., medroxyprogesterone acetate injection) given at least 14 days prior to screening; OR
- Intrauterine device or intrauterine system; OR
- Vasectomy (with the appropriate post vasectomy documentation of the absence of sperm in the ejaculate) where the vasectomized male is the sole partner for the female study subject; OR
- Tubal ligation.

If subjects cannot access or use a highly effective method, a combination of male condom with either a cervical cap, diaphragm, or sponge with spermicide (double barrier methods) are also considered acceptable **but are not considered highly effective birth control methods**. In such cases the Investigator must document the reason why highly effective methods cannot be used and discuss the risks involved as well as alternative contraceptive requirements with the subject.

The following forms of contraception are not permissible as the sole method of contraception for this study:

- A single barrier method of contraception (male condom, female condom, cervical cap, diaphragm, contraceptive sponge)
- Periodic abstinence (e.g., calendar, ovulation, symptothermal, post-ovulation methods)
- Withdrawal (coitus interruptus)
- Spermicide only
- Lactational amenorrhea method

### 9.3. Prohibited Medications

The following medications may not be used during the study:

- Nebulized amphotericin B
- Any investigational agent or any investigational antifungal agent, including an approved antifungal medication administered via an unapproved route

<b>Study Number: PC_ASP_006</b> Protocol	Compound No.: PC945 Amendment 5
---	------------------------------------

- After randomization, use of other inhaled medications should be avoided. If an inhaled medication must be used, it must be administered approximately 60 minutes before or approximately 90 minutes after the administration of study medication
- While an inhaled bronchodilator may be used given the background medical history of the subject it may not be administered immediately prior to the administration of study medication
- If a subject develops bronchospasm after the administration of the blinded study medication, an inhaled bronchodilator may be used as soon as is clinically indicated in the opinion of the Investigator

For SOC antifungal medications, the Investigator should follow the approved product labels of the respective medication with regards to which other medications are contraindicated.

## 10. SUBJECT COMPLETION AND WITHDRAWAL

### 10.1. Subject Completion

A subject will be considered to have completed the study if he or she has completed assessments up to and including the Day 112 Safety Follow-Up Visit or if he or she has died during the study. The Investigator or designee will record in the eCRF whether the subject completed the study and whether the subject completed the 84-day (12-week) study medication treatment regimen.

### 10.2. Subject Withdrawal

Within the provisions of informed consent and good clinical judgment with respect to the subject's safety, every attempt should be made to have subjects complete both treatment (through Day 84) and follow up (through Day 112) parts of the study. Subjects will be informed that they are free to withdraw from the study at any time.

It is important that the Investigator documents information explaining why a subject withdraws or is discontinued from study treatment. This information, together with AEs occurring at those times, may help inform the cause-specific reasons for why some subjects remain on the assigned treatment while others do not.

The Investigator will immediately inform the Medical Monitor of early treatment discontinuation due to subject's withdrawal from the study.

Note that if a subject requires "rescue" antifungal treatment with a systemic antifungal agent at any time in the study, this will not automatically require that the subject be withdrawn from the study nor will the administration of IP need to be stopped. In general, all subjects should be followed as closely as possible to the study schedule of assessment if

<b>Study Number: PC_ASP_006</b> Protocol	Compound No.: PC945 Amendment 5
---	------------------------------------

they consent to do so regardless of whether or not they are willing or able to take their blinded study medication through Day 84 (Week 12).

### 10.2.1. Subject Withdrawal from Study

In accordance with the Declaration of Helsinki, International Conference on Harmonization (ICH) Good Clinical Practice (GCP) Guidelines, and the U.S. FDA regulations, a subject has the right to withdraw from the study at any time for any reason without prejudice to their future medical care by the physician or at the institution.

Although subjects are not obliged to give their reason for withdrawing consent, the Investigator will make a reasonable effort to obtain the reason while fully respecting the subjects' rights. Reasons for withdrawal of consent, when provided by the subject, will be recorded in the eCRF. The Investigator will immediately inform the Medical Monitor of the decision of a subject to withdraw consent for study participation.

If a subject withdraws consent for disclosure of future information, the sponsor may retain and continue to use any data collected before such a withdrawal of consent.

If a subject withdraws entirely from the study, they may request destruction of any samples taken and not tested, and the Investigator must document this in the site study records.

The Investigator may withdraw a subject from the study for any of the following reasons:

- Withdrawal of consent
- Lost to follow-up
- The Investigator or Sponsor determines that a subject's continued participation in all aspects of the study (including passive safety follow-up) would not be in the best medical interest of the subject
- The Sponsor closes the study

All subjects withdrawn early from further study prior to Day 84 will be required to complete the Day 84/Early Termination Visit on the day of withdrawal or as soon as possible after the last dose of the blinded study medication. Subjects withdrawn from the study for any reason will not be replaced.

For subjects that withdraw after Day 84 or are lost to follow-up, every reasonable effort will be made to contact a subject who fails to attend a Study Visit, or does not respond by telephone, in order to ensure that the subject is in satisfactory health.

Site personnel, or an independent third party, will attempt to collect the vital status of all subjects randomized, including those who did not receive any doses of study medication, in accordance with applicable laws and regulations. This may include collection of private information through interaction (e.g. follow-up scans, physical exams etc.) or from the subject's medical records based on subject's consent for continued collection of data based on non-interventional procedures to support safety follow-up. Public sources may be consulted, if permitted under applicable laws, for vital status information. If vital status is

<b>Study Number: PC_ASP_006</b> Protocol	Compound No.: PC945 Amendment 5
---	------------------------------------

determined as deceased, this will be documented, and the subject will not be considered lost to follow-up. Sponsor personnel will not be involved in any attempts to collect vital status information.

### 10.2.2. Subject Discontinuation from Study Medication

The Investigator and/or the Sponsor Medical Monitor may exercise his or her medical judgment to terminate a subject's study treatment because of clinically significant changes in any clinical or laboratory parameter however those subjects should remain attending all study visits through Day 112.

Every reasonable effort must be made by study personnel to keep subjects on study treatment. However, study medication may be discontinued for any of the reasons below. Subjects who discontinue from study medication should be encouraged to complete all study visits per protocol while observing the following principles:

- ECG assessments that would be performed at pre- or post-study drug dose timings can be performed as a single assessment on the day of the visit when there is no 'dose'
- PK samples should continue to be collected at study visits per the planned protocol schedule for all subjects regardless of any early treatment discontinuation. Note that when there is no study drug dosing, a single PK blood draw is required at study visits per the protocol schedule.
- Antifungal SOC dosing diary and compliance should be completed through Day 112 visit

In addition to the scheduled protocol visits, subjects who have been discontinued from study medication may also undergo additional medical follow-up at the discretion of the Investigator. Subjects discontinued from the administration of study medication for any reason will not be replaced.

The following may cause the subject to be discontinued from further study medication administration:

- Adverse events that the Investigator considers to be related to study medication and that also meet one of the following criteria:
  - Is serious or severe
  - Is otherwise clinically significant (e.g., allergic reaction)
  - Unacceptable tolerability of the study medication
  - Death
- Suspected drug-drug interaction
- Progressive disease or significant clinical progression at an earlier time point, if judged by the Investigator to be in the subject's best interests

Study Number: PC_ASP_006 Protocol	Compound No.: PC945
	Amendment 5

- Clinically significant intercurrent illness that could compromise the safety of the subject or the scientific value of the study
- Significant deviation from the protocol on the part of the subject that would lead to a medically unacceptable risk to the subject or compromise the scientific value of the study
- Requirement to use contraindicated medication that could compromise the safety of the subject
- Termination of the study by Pulmocide Limited
- Subject becomes pregnant (subject to be followed until delivery or termination of pregnancy. In the case of a live birth, subject will be followed for 30 days after the live birth)

In the event that a subject discontinues from study medication and also does not agree to follow the study schedule and/or declines some or all study assessments or procedures per the protocol schedule, site staff should seek agreement from the subject for safety follow-up. Collection of data available per routine care should be reported in eCRFs per the protocol schedule. In such cases, off-schedule or missed procedures (i.e., due to the subject declining them) will not be recorded as a deviation to the protocol.

### 10.3. Treatment After the End of the Study

Given that PC945 is still an investigational product, it will not be made available to trial subjects following their completion of the study.

### 10.4. Screen Failures

Rescreening of subjects will be permitted under certain circumstances. Please refer to [Section 6.1.1](#).

The following data on screen failures will be entered in the eCRF:

- Visit Date
- Informed Consent
- Inclusion/exclusion criteria
- Demography
- Adverse events (if applicable, [Section 11.2.1](#))

Study Number: PC_ASP_006 Protocol	Compound No.: PC945 Amendment 5
--------------------------------------	------------------------------------

## 11. ADVERSE EVENTS AND SERIOUS ADVERSE EVENTS

### 11.1. Definition of an Adverse Event

An AE is defined as: “Any untoward medical occurrence in a subject or clinical investigation subject administered a pharmaceutical product and which does not necessarily have a causal relationship with this treatment” (ICH Guideline “Clinical Safety Data Management: Definitions and Standards for Expedited Reporting” E2A). An AE can therefore be any unfavorable or unintended sign (including an abnormal laboratory finding), symptom, or disease temporally associated with the use of a medicinal (investigational) product, whether or not related to the medicinal (investigational) product. This includes:

- Any new medical condition, sign or symptom, or newly diagnosed event that occurs during the AE reporting period ([Section 11.2.1](#)), including signs or symptoms associated with an underlying condition that were not present prior to the AE reporting period
- A previous condition that has worsened in severity or frequency or changed in character during the AE reporting period
- Complications that occur as a result of protocol-mandated interventions. An AE can arise from any use of the investigational drug (e.g., off-label use, use in combination with another drug) and from any route of administration, formulation, or dose, including an overdose

For the purposes of this protocol, events that are not considered AEs include:

- Worsening of the study condition (IPA) unless a serious criterion is met. (Note that symptoms of worsening IPA are captured in study efficacy assessments)
- Anticipated fluctuating signs or symptoms of a pre-existing medical condition including the anticipated toxicities or adverse drug reactions related to the pharmacotherapy for the underlying condition (e.g., nausea and vomiting or mucositis related to chemotherapy, tremor in a subject with Parkinson’s Disease; migraine episodes) that have not worsened in severity or frequency or changed in character during the AE reporting period
- Anticipated fluctuating signs or symptoms related to the immediate posttransplant procedure (where applicable) unless the Investigator believes that the event is related to the study medication or the event meets any of the criteria for a SAE ([Section 11.1.3](#))
- Recognized complications of the organ or hematopoietic stem cell transplant procedure, if applicable, (such as pain, delayed wound healing, hemorrhage, hemothorax, pneumothorax, cardiac tamponade, pulmonary artery thrombosis, pulmonary edema, pericarditis, the requirement for re-intubation, arterial and venous thrombosis and stenosis, biliary disorders, fluid collections, and graft

<b>Study Number: PC_ASP_006</b> Protocol	Compound No.: PC945 Amendment 5
---	------------------------------------

rejection, etcetera) unless the Investigator believes that the event is related to the study medication or the event meets any of the criteria for a SAE ([Section 11.1.3](#))

- Surgeries or medical procedures – the medical condition (new or worsened) that led to the surgery or medical procedure would be the reported AE (e.g., for appendicitis resulting in appendectomy, appendicitis would be reported as the AE)
- Overdose without clinical signs or symptoms
- Pregnancy ([Section 11.4](#))

Abnormal laboratory findings (e.g., clinical chemistry, hematology, and urinalysis) or other abnormal assessments (e.g., ECGs or vital signs) that are judged by the Investigator as clinically significant will be recorded as AEs if they meet the definition of an AE. Clinically significant abnormal laboratory findings or other abnormal assessments that are detected during the study or are present at baseline and worsen following the start of the study will be reported as AEs. However, clinically significant abnormal laboratory findings or other abnormal assessments that are associated with the disease being studied (IPA) or that are associated with the underlying disease (for example the underlying malignancy or the underlying disease which led to the solid organ transplant, etc.), unless judged by the Investigator as more severe than expected for the subject's condition, or that are present or detected at the start of the study and do not worsen, will not be reported as AEs. The Investigator will exercise his or her medical and scientific judgment in deciding whether an abnormal laboratory finding or other abnormal assessment is clinically significant.

#### 11.1.1. Adverse drug reaction

An adverse drug reaction is any AE where the causal relationship between the medicinal product and the AE is at least reasonably possible (i.e., a relationship cannot be ruled out).

#### 11.1.2. Unexpected Adverse Drug Reaction

An adverse reaction, the nature or severity of which is not consistent with the applicable product information (e.g., the IB for unauthorized IP, or summary of product characteristics or package insert/prescribing information for an authorized product).

#### 11.1.3. Definition of Serious Adverse Events

A serious adverse event is any untoward medical occurrence that at any dose:

- Results in death
- Is immediately life-threatening

(The subject was at immediate risk of death at the time of the event. It does not refer to an event that hypothetically might have caused death if it were more severe)

- Requires inpatient hospitalization or prolongation of existing hospitalization
- Results in persistent or significant disability/incapacity

<b>Study Number: PC_ASP_006</b> Protocol	Compound No.: PC945
	Amendment 5

- Is a congenital anomaly/birth defect
- Is Medically Important\*

\*Medical and scientific judgement should be exercised in deciding whether reporting is appropriate in other situations, such as important medical events that may not reach the above definition but may jeopardize the subject or may require medical or surgical intervention to prevent one of the other outcomes listed in the above definition. These should also be considered serious. Examples of such events are invasive or malignant cancers, intensive treatment in an accident and emergency department or at home for allergic bronchospasm, blood dyscrasias or convulsions that do not result in hospitalization, or development of drug dependency or drug abuse.

A subject is classified as having undergone an inpatient hospitalization if they are admitted to the hospital overnight. Outpatient visits or short visits to the emergency room (less than 24 hours) do not meet this criterion.

For the purposes of this protocol, events that are not considered SAEs include:

- Hospitalization for a previously planned post-transplant bronchoscopy unless associated with an adverse event
- Hospitalization for a previously planned therapy (e.g., chemotherapy) or surgery associated with a condition present prior to informed consent signature that has not worsened during the AE reporting period

#### **11.1.4. Definition of a Suspected Unexpected Serious Adverse Reaction**

A suspected unexpected serious adverse reaction (SUSAR) is an AE that is believed to be related (possibly, probably or definitely related) to an investigational medicinal product and is both unexpected (i.e., the nature or severity is not expected from the information provided in the IB) and serious.

## **11.2. Procedures for Eliciting, Recording, and Reporting Adverse Events**

### **11.2.1. Adverse Event Reporting Period**

All AEs, including SAEs and other events for expedited reporting ([Section 11.3](#)), regardless of seriousness, severity, or presumed relationship to study drug, must be recorded in the source documents and in the eCRF according to the following reporting periods:

- From signing of informed consent until randomization: only AEs occurring as a result of the screening process (procedures) will be recorded (for subjects who are randomized, any clinically relevant or significant observations occurring not as a result of the screening process after the subject has signed consent but prior to randomization will be recorded on the medical history page of the eCRF).

<b>Study Number: PC_ASP_006</b> Protocol	Compound No.: PC945 Amendment 5
---	------------------------------------

- From randomization until 30 days following the last dose of study medication or the subject's last AE assessment in the study (last subject visit), whichever occurs later: all adverse events will be recorded (unless the AE, or SAE, is considered related to the study medication, which then requires that the AE be reported, regardless of the amount of time that has passed since receiving the last dose of study medication).

During the study, all AEs/SAEs will be followed until resolution, stabilization, the event is otherwise explained, or the subject is lost to follow-up (as defined in [Section 10.2](#)).

Any AEs (including SAEs) that are unresolved at the subject's last AE assessment in the study (last subject's visit in the study) are followed up by the Investigator for as long as medically indicated and pertinent details recorded in the eCRF as applicable until database lock. After database lock, the Investigator may provide the final outcome for the event, including any additional clinically significant information regarding the AE or SAE, to the Sponsor on the paper Reporting Form as medically indicated. The Sponsor retains the right to request additional information for any subject with ongoing AE(s)/SAE(s) at the end of the study, if judged necessary.

### 11.2.2. Eliciting Adverse Events

Information on AEs and SAEs will be elicited at each AE assessment time point specified in the Time and Events Schedule ([Section 16.1](#)) by asking the subject an open-ended question such as: "Since you were last asked, have you felt unwell or different from usual in any way?" The subject may report AEs spontaneously at any time.

### 11.2.3. Adverse Events of Special Interest

Adverse events of special interest will include the signs and symptoms of drug-induced bronchospasm following the administration of IP. Please refer to [Section 6.8.3](#), Assessing for Adverse Events of Special Interest, for more information.

Adverse Events of Special Interest, including non-serious events, are to be reported using the SAE Report form. All fields are to be completed including the narrative description section. Non-serious Adverse Events of Special Interest are to be reported within two weeks of investigational site awareness. Adverse Events of Special Interest will be reported to the pharmacovigilance (PV) provider as per [Section 11.2.6](#) – Recording Adverse Events.

Follow-up information for non-serious Adverse Events of Special Interest must also be reported to Pulmocide or designee on the SAE Report Form and entered into the eCRF within two weeks of the site's awareness of the new information.

### 11.2.4. Assessing the Severity of AEs

AEs will be graded by the Investigator according to the Common Terminology Criteria for Adverse Events (CTCAE), Version 5.0 ([Section 16.3](#)). Where an adverse event is not represented in this reference toxicity grading table, the assessment of severity grade will be made by the Investigator using the following general categorical descriptors:

Study Number: PC_ASP_006 Protocol	Compound No.: PC945
	Amendment 5

- Mild: Awareness of symptoms that are easily tolerated, causing minimal discomfort and not interfering with everyday activities
- Moderate: Sufficient discomfort is present to cause interference with normal activity
- Severe: Extreme distress, causing significant impairment of functioning or incapacitation. Prevents normal everyday activities

The term “severe” is often used to describe the intensity of a specific event; the event itself, however, may be of relatively minor medical significance, such as severe headache. Severe is not the same as serious, which is a regulatory definition ([Section 11.1.3](#)).

### 11.2.5. Assessing Relatedness or Attribution

The Investigator will also assess the relationship between the AE and the study medication according to the following criteria:

- Not related: The event is related to an etiology other than to PC945 medication (the alternative etiology must be documented in the study subject’s medical record)
- Related: There is a temporal association between the event and the administration of study medication and there is a plausible mechanism for the event to be related to the investigational drug and causes other than the study product have been ruled out, and/or the event reappeared on re-exposure to the investigational drug. Conditions that may be considered a result of the lack of efficacy of the study drug are not considered adverse events, and they will be captured during the assessment of fungal disease or colonization.

### 11.2.6. Recording Adverse Events

All AEs and SAEs, whether spontaneously reported by the subject or elicited or noted by study staff, will be recorded in the subject’s medical record and reported on the appropriate AE page of the eCRF per [Section 11.1](#) and [Section 11.2](#). In addition, a SAE Report Form must be completed per the instructions provided to report each SAE and AESI.

All AEs should be recorded using the words of the subject (verbatim term) to describe the AE, with two exceptions: if the verbatim term is vague or ambiguous (e.g., cramps), the study staff should try to obtain clarification by asking a follow-up question (e.g., what kind of cramps?) and record the words the subject used to clarify the event (e.g., menstrual cramps, calf muscle cramps).

If the subject reports a group of symptoms and the Investigator is comfortable with a unifying diagnosis, the diagnosis should be recorded (e.g., rhinopharyngitis instead of runny nose, cough, sore throat, and sneezing). At a minimum, the following information should be captured for each AE:

- Date of onset and resolution
- Outcome

<b>Study Number: PC_ASP_006</b> Protocol	Compound No.: PC945 Amendment 5
---	------------------------------------

- Severity
- Seriousness
- Relatedness to study medication
- Action taken with study medication
- Treatments administered

Any treatment administered as a result of an AE should be recorded on the Concomitant Medication eCRF.

### 11.3. Serious Adverse Events Reporting

#### 11.3.1. Serious Adverse Events Notification

The Investigator has the obligation to report each SAE to Pulmocide or designee within 24 hours of knowledge of the occurrence. This includes SAEs that occur within 30 days after the last dose of study medication. Additionally, if the Investigator learns of any SAE that occurred after the Follow-up Period for which there is a reasonable possibility of relatedness to the study medication (as defined in [Section 11.2.5](#)), that event must be reported within 24 hours. Study reference manuals will contain the contact details of the Sponsor or designated safety representative(s) as well as the information on where and how to submit the SAE Report Form.

Serious Adverse Events must be reported by entering the SAE information into the eCRF and by completing the SAE Report Form per instructions provided. If the event meets serious criteria and it is not possible to access the eCRF, the SAE Report Form must still be provided within 24 hours of the site's awareness. The SAE information must be entered into the eCRF as soon as the eCRF system becomes accessible.

Cause of death is required whenever known. If an autopsy was performed, an autopsy report should be provided. Death should be reported as an outcome and not as an event.

The following information related to the SAE must be collected:

- Subject identification (subject study number, year of birth, gender, and race or ethnicity)
- Date of first study treatment dose
- Date and amount of last study treatment dose
- Whether the subject was taking study treatment at the time of the SAE
- Date, duration/end date, diagnosis or description of SAE
- Events and symptoms leading up to the SAE
- Action taken, including whether subject was withdrawn from study
- Study treatment status (e.g., no change, interrupted, discontinued, dose changed)

<b>Study Number: PC_ASP_006</b> Protocol	Compound No.: PC945 Amendment 5
---	------------------------------------

- Concomitant therapy (including doses, routes, and regimens)
- Pertinent laboratory data
- Medical history (including time on study prior to AE and history that might be related to the AE)
- Severity of AE
- Investigator's assessment of the relationship of the AE to study treatment
- Outcome of the AE

All SAEs that have not resolved by the end of the study, or that have not resolved upon discontinuation of the subject's participation in the study, must be followed until any of the following occurs:

- The event resolves
- The event stabilizes
- The event returns to baseline, if a baseline value/status is available
- The event can be attributed to agents other than the study drug or to factors unrelated to study conduct
- It becomes unlikely that any additional information can be obtained (subject or health care practitioner refusal to provide additional information, lost to follow-up after demonstration of due diligence with follow-up efforts)

Follow-up information for SAEs must also be reported to Pulmocide or designee on the SAE Report Form and entered into the eCRF within 24 hours of the site's awareness of the new information.

### **11.3.2. Serious Adverse Events Expedited Reporting**

The Sponsor or the sponsor's designee will report all SUSARs or other expedited safety reports to the applicable Regulatory Authorities. All SUSARs will be reported to regulatory authorities unblinded and in accordance with local laws and regulations (e.g., EU Clinical Trials Regulation 536/2014). Investigators will be notified of all SUSARs or other expedited safety reports. The Investigator (or Sponsor where required) must report SUSARs or other expedited safety reports to the appropriate IRB/REC that approved the protocol unless otherwise required and documented by the IRB/REC.

### **11.3.3. Other Events to be Considered for Expedited Reporting**

Other safety events that may require expedited reporting and/or an evaluation of safety include, but are not limited to:

- Suspected abuse or misuse of the study medication
- Overdose of the study medication if associated with clinical signs or symptoms

Study Number: PC_ASP_006 Protocol	Compound No.: PC945
	Amendment 5

- Inadvertent or accidental exposure to the study medication
- Medication or dosing error involving the study medication

Other safety events should be recorded in the subject eCRF and source documents. Any safety event meeting the above criteria should be recorded on an SAE Report Form and reported to the PV provider as per [Section 11.3.1](#).

#### 11.4. Procedures for Reporting Pregnancy Exposure and Birth Events

Pregnancy in itself is not regarded as an AE unless there is a suspicion that a study drug may have interfered with the effectiveness of a contraceptive medication.

All initial reports of pregnancy from randomization to 30 days after last dose of study medication or of pregnancy in female partners of male subjects, must be reported to the Sponsor's pharmacovigilance provider by the study site personnel within 24 hours of their knowledge of the event using a pregnancy notification form (as per [Section 11.3.1](#)). The outcome of all pregnancies (spontaneous miscarriage, elective termination, normal birth, or congenital abnormality) must be followed up and documented even if the subject was discontinued from the study. In the case of a live birth, additional follow-up will be conducted at 30 days after birth. Elective abortions without complications should not be handled as AEs. Abnormal pregnancy outcomes (e.g., spontaneous abortion, fetal death, stillbirth, congenital anomalies, ectopic pregnancy) are considered SAEs and must be reported using the SAE Report Form. Consent to obtain follow-up information regarding the outcome of the pregnancy and any postnatal sequelae in the infant will be included in the subject informed consent form and in a pregnant partner informed consent form.

Pregnancy must be reported by entering the pregnancy information on the paper Pregnancy Report form and should be followed until outcome is known. The outcome of pregnancy should also be reported on a follow-up Pregnancy Report form. Any subject who becomes pregnant during the study must be promptly withdrawn from study treatment but should continue follow-up as described previously in [Section 10.2.2](#). Any male subject whose partner becomes pregnant during the study will not need to stop taking the study medication.

## 12. DATA ANALYSIS AND STATISTICAL CONSIDERATIONS

This section presents the key elements of the planned statistical analysis of the data resulting from this trial. Additional detail will be provided in a Statistical Analysis Plan (SAP).

All deviations from the protocol or SAP will be documented in the final study report.

<b>Study Number: PC_ASP_006</b>
Protocol

Compound No.: PC945
Amendment 5

## 12.1. Study Design Considerations

### 12.1.1. Sample Size Justification

A 10x20 grid of orange 'C' characters on a black background. The grid is mostly filled, but there are missing characters in the bottom right corner, creating a jagged edge. The missing characters are located in the following positions (row, column): (10, 19), (9, 19), (8, 19), (7, 19), (6, 19), (5, 19), (4, 19), (3, 19), (2, 19), (1, 19), (1, 18), (1, 17), (1, 16), (1, 15), (1, 14), (1, 13), (1, 12), (1, 11), (1, 10), (1, 9), (1, 8), (1, 7), (1, 6), (1, 5), (1, 4), (1, 3), (1, 2), (1, 1), (2, 18), (2, 17), (2, 16), (2, 15), (2, 14), (2, 13), (2, 12), (2, 11), (2, 10), (2, 9), (2, 8), (2, 7), (2, 6), (2, 5), (2, 4), (2, 3), (2, 2), (2, 1), (3, 18), (3, 17), (3, 16), (3, 15), (3, 14), (3, 13), (3, 12), (3, 11), (3, 10), (3, 9), (3, 8), (3, 7), (3, 6), (3, 5), (3, 4), (3, 3), (3, 2), (3, 1), (4, 18), (4, 17), (4, 16), (4, 15), (4, 14), (4, 13), (4, 12), (4, 11), (4, 10), (4, 9), (4, 8), (4, 7), (4, 6), (4, 5), (4, 4), (4, 3), (4, 2), (4, 1), (5, 18), (5, 17), (5, 16), (5, 15), (5, 14), (5, 13), (5, 12), (5, 11), (5, 10), (5, 9), (5, 8), (5, 7), (5, 6), (5, 5), (5, 4), (5, 3), (5, 2), (5, 1), (6, 18), (6, 17), (6, 16), (6, 15), (6, 14), (6, 13), (6, 12), (6, 11), (6, 10), (6, 9), (6, 8), (6, 7), (6, 6), (6, 5), (6, 4), (6, 3), (6, 2), (6, 1), (7, 18), (7, 17), (7, 16), (7, 15), (7, 14), (7, 13), (7, 12), (7, 11), (7, 10), (7, 9), (7, 8), (7, 7), (7, 6), (7, 5), (7, 4), (7, 3), (7, 2), (7, 1), (8, 18), (8, 17), (8, 16), (8, 15), (8, 14), (8, 13), (8, 12), (8, 11), (8, 10), (8, 9), (8, 8), (8, 7), (8, 6), (8, 5), (8, 4), (8, 3), (8, 2), (8, 1), (9, 18), (9, 17), (9, 16), (9, 15), (9, 14), (9, 13), (9, 12), (9, 11), (9, 10), (9, 9), (9, 8), (9, 7), (9, 6), (9, 5), (9, 4), (9, 3), (9, 2), (9, 1), (10, 18), (10, 17), (10, 16), (10, 15), (10, 14), (10, 13), (10, 12), (10, 11), (10, 10), (10, 9), (10, 8), (10, 7), (10, 6), (10, 5), (10, 4), (10, 3), (10, 2), (10, 1).

#### 12.2.3.3. Evaluation of the Secondary Efficacy Outcomes

The CCI logo, consisting of the letters 'CCI' in a bold, orange, sans-serif font.

CCCCC

The image shows the Creative Commons Attribution-NonCommercial-ShareAlike (CC BY-NC-SA) license logo. It consists of four circular icons in a row: the first contains the letters 'cc' for Creative Commons, the second contains a person icon representing 'BY' (attribution), the third contains a crossed-out dollar sign representing 'NC' (non-commercial), and the fourth contains a circular arrow representing 'SA' (share-alike). Below the icons is the text 'BY NC SA' in a sans-serif font.

The primary, secondary, and exploratory efficacy outcomes will be summarized descriptively by the following subgroups (mITT population):

- 
- High risk vs low risk subjects ([Section 4.1.2](#)) for the definition of high vs low risk subjects)
-   
  

CC|CC|CC|CC|CC|CC|CC|CC|CC|CC|CC|CC|CC|CC|CC|CC|

CC|CC|CC|CC|CC|CC|CC|CC|CC|CC|CC|CC|CC|CC|CC|CC|

# CCI

The CCI logo, consisting of the letters 'CCI' in a bold, orange, sans-serif font.

CC|CC|CC|CC|

safety.  The DSMB will not c

In general, missing data will not be imputed. For the primary and secondary analyses, the method for incorporating subjects with incomplete data is described in [Sections 12.2.3.1](#) and [12.2.3.2](#), respectively.

The study will be conducted in accordance with all applicable regulatory requirements.

Study Number: <b>PC_ASP_006</b> Protocol	Compound No.: PC945
	Amendment 5

#### Specific to the European Region (EU):

In accordance with the Clinical Trials Regulation No 536/2014, Article 2.2 (8), (April 2014), the authorised SOC used in accordance with their marketing authorisations within the protocol are categorized and referenced in the EU as Auxiliary Medicinal Products (AxMPs).

The study will be conducted in accordance with ICH-GCP, all applicable subject privacy requirements and the ethical principles that are outlined in the Declaration of Helsinki 2013, including, but not limited to:

- An Independent Ethics Committee (IEC)/IRB review and approval of study protocol and any subsequent amendments and all ICFs or other information given to the subject
- Subject informed consent
- Investigator reporting requirements

The Sponsor will provide full details of the above procedures, either verbally, in writing, or both.

Informed consent must be obtained from each subject before participation in the study. Written or electronic informed consent will be collected (informed consent by electronic means –only if permitted according to national law) following a review of the subject information by the potential subject and a discussion between the subject and the Investigator or suitably qualified designee. The study may be discussed with potential subjects and informed consent provided after the initial diagnosis of IPA is made and before response to SOC antifungal therapy has been assessed. However, informed consent (written or electronic), when permissible according to national law) must be obtained prior to the initiation of any study specific screening procedures. If a subject is unable to provide written informed consent, the subject's legally acceptable representative (i.e., acceptable to ICH and local law, as applicable) may provide written consent, as approved according to institution-specific guidelines. The ICF must be signed and dated by the subject, or the subject's legally acceptable representative, prior to study participation. A copy of the ICF must be provided to the subject or the subject's legally acceptable representative.

The Investigator will cooperate with all regulatory inspections and will notify the Sponsor as soon as they are aware of an inspection which may involve this study. With the exception of statutory regulatory authority inspections, the Sponsor will be consulted in the event of inspection of a clinical site by an outside authority before the Inspectors are permitted access to any of the study records or the study areas.

## **13.2. Study Monitoring**

In accordance with applicable regulations, ICH-GCP, the monitoring plan and the Sponsor's and/or delegate procedures, monitors will contact the site before the start of the study to review with the site staff the protocol, study requirements, and their

Study Number: PC_ASP_006 Protocol	Compound No.: PC945
	Amendment 5

responsibilities to satisfy regulatory, ethical, and the Sponsor's requirements. When reviewing data collection procedures, the discussion will include identification, agreement and documentation of data items for which the eCRF will serve as the source document.

The Sponsor and or delegated monitors will perform risk-based monitoring during the conduct of the study to ensure that:

- The data are authentic, accurate and complete
- The subject's safety and rights are being protected
- The study is conducted in accordance with the currently approved protocol and any other study agreements, ICH-GCP and all applicable regulatory requirements

As described in FDA Guidance on Conduct of Clinical Trials of Medical Products during COVID-19 Public Health Emergency, the Sponsor may consider optimizing use of central and remote monitoring programs to maintain oversight of clinical sites if planned on-site monitoring visits are no longer possible ([FDA Guidance, 2021](#)).

### 13.2.1. Access to Source Data

The Investigator and the head of the medical institution (where applicable) agree to allow the monitor, Sponsor-appointed auditors and regulatory inspectors direct access to all consented subjects' relevant and original source documents.

### 13.2.2. Data Handling and Record Keeping

Following closure of the study, the Investigator or head of the medical institution (where applicable) must maintain all site study records (except for those required by local regulations to be maintained elsewhere) in a safe and secure location. The records must be easily accessible when needed (e.g., for a Sponsor audit or regulatory inspection) and must be available for review in conjunction with assessment of the facility, supporting systems, and relevant site staff.

Where permitted by local laws/regulations or institutional policy, some or all of the records may be maintained in a format other than hard copy (e.g., microfiche, scanned, electronic); however, caution must be exercised before such action is taken. The Investigator must ensure that all reproductions are legible and are a true and accurate copy of the original. In addition, they must meet accessibility and retrieval standards, including regeneration of a hard copy, if required. The Investigator must also ensure that an acceptable back-up of the reproductions exists and that there is an acceptable quality control procedure in place for creating the reproductions.

The Sponsor will inform the Investigator of the time period for retaining the site records in order to comply with all applicable regulatory requirements. The minimum retention time will meet the strictest standard applicable to a particular site, as dictated by local laws/regulations, the Sponsor standard operating procedures and/or institutional requirements.

<b>Study Number: PC_ASP_006</b> Protocol	Compound No.: PC945 Amendment 5
---	------------------------------------

The Investigator must notify the Sponsor of any changes in the archival arrangements, including, but not limited to archiving of records at an off-site facility or transfer of ownership of the records in the event that the Investigator is no longer associated with the site.

Local laws related to data protection will be followed.

### **13.3. Data Management**

For this study, subject data will be collected using an eCRF and combined with data provided from other sources in a validated data system.

Management of clinical data will be performed in accordance with the applicable Sponsor and their study representative's standards and data cleaning procedures to ensure the integrity of the data, e.g., removing errors and inconsistencies in the data. Adverse events and concomitant medications terms will be coded using industry standard dictionaries (e.g., MedDRA and World Health Organization [WHO] drug dictionary).

When using electronic trial data handling and/or remote electronic trial data systems, the Sponsor or designee will:

- a. Ensure and document that the electronic data processing system(s) conforms to the Sponsor's established requirements for completeness, accuracy, reliability, and consistent intended performance (i.e., validation)
- b. Maintain standard operating procedures for using these systems
- c. Ensure that the systems are designed to permit data changes in such a way that the data changes are documented and that there is no deletion of entered data (i.e., maintain an audit trail, data trail, edit trail)
- d. Maintain a security system that prevents unauthorized access to the data, and policies to describe measures implemented in case of a data security breach
- e. Maintain a list of the individuals who are authorized to make data changes
- f. Maintain adequate backup of the data
- g. Safeguard the blinding, if any (e.g., maintain the blinding during data entry and processing)

Training on the use of the electronic data collection system will be provided to all relevant study site staff.

### **13.4. Insurance, Indemnity, and Finance**

The Sponsor maintains appropriate insurance coverage for clinical studies and will follow applicable local compensation laws.

The Sponsor will indemnify all Investigators participating in this study against future claims by study subjects who were administered study medication; the terms of this will be

Study Number: PC_ASP_006 Protocol	Compound No.: PC945
	Amendment 5

detailed within a separate letter of indemnification. The indemnity will only apply where all study procedures have been carried out according to this protocol.

The financial aspects of the study are addressed in a separate agreement.

### **13.5. Study Administration During the COVID-19 Public Health Emergency**

The FDA issued guidance in March 2020 (updated 30 August 2021) providing general considerations to assist Sponsors in assuring the safety of trial subjects, maintaining compliance with GCP, and minimizing risks to trial integrity for the duration of the COVID-19 public health emergency ([FDA Guidance, 2021](#)).

In the event that an unexpected and extenuating situation develops which may have an impact on study conduct (e.g., a public health emergency such as a pandemic disease), certain protocol deviations (e.g., administering the study drug or adhering to protocol-mandated visits and laboratory/diagnostic testing) may be unavoidable. In this situation, the Investigator must inform the Sponsor that the subject may not meet pre-specified protocol requirements.

In the above situation, the Sponsor should evaluate whether alternative methods for performing safety assessments (e.g., phone contact, virtual visit, and alternative location for assessment, including local labs or imaging centers) could be implemented and if they would be sufficient to assure the safety of subjects. They will also consider if alternative secure delivery methods are required to deliver PC945 to the subjects. The Sponsor will determine if a protocol amendment is required to implement the alternative methods.

Furthermore, the Sponsor will determine if in-person visits are necessary to fully assure the safety of subjects enrolled in the trial (for example to carry out procedures to assess subject safety or to ensure safe use of the study drugs); in making the decision to continue administration of the study drugs, the Sponsor and the Investigator should discuss and consider whether the safety of trial subjects can be assured with the implementation of the altered safety monitoring approach.

## **14. PUBLICATION**

Following completion of the study, the data from the entire study or from subsets of the study will be considered for reporting at a scientific meeting or for publication in a scientific journal, in which case the Sponsor will be responsible for these activities and will work with the Investigator to determine how the manuscript is written and edited, the number and order of authors, the publication to which it will be submitted and other related issues.

To comply with data disclosure transparency requirements and/or regulations, a description of the clinical trial and results will be registered in applicable government registry databases (e.g., ClinicalTrials.gov, EudraCT).

Study Number: PC_ASP_006 Protocol	Compound No.: PC945 Amendment 5

## 16.6. Appendix 6: Diagnostic Criteria for Invasive Pulmonary Aspergillosis and for Refractoriness and Overall or Mycological Response

### 16.6.1. Modified 2019 EORTC/MSGERC consensus definitions ([Donnelly 2020](#)) for [Inclusion Criterion 6](#)

**Table 8 Criteria for Proven Invasive Pulmonary Aspergillosis - 2019 EORTC/MSGERC Consensus Definitions ([Donnelly 2020](#))**

Proven Invasive Pulmonary Aspergillosis	
Microscopy analysis (needle aspiration or biopsy of respiratory or pulmonary tissue obtained from a sterile procedure, excluding BAL fluid)	Histopathologic, cytopathologic, or evidence of direct microscopy examination in which hyphae morphologically consistent with <i>Aspergillus</i> spp. are observed together with associated tissue damage
OR:	
Culture (respiratory or pulmonary tissue obtained from a clinically or radiologically abnormal site consistent with an infectious disease process using a sterile procedure, excluding BAL fluid)	Positive culture for <i>Aspergillus</i> spp.
OR:	
Tissue nucleic acid diagnosis	Positive for <i>Aspergillus</i> spp. by PCR combined with DNA sequencing

<b>Study Number: PC_ASP_006</b>	Compound No.: PC945
Protocol	Amendment 5

**Table 9 Criteria for Probable Invasive Pulmonary Aspergillosis – Modified 2019 EORTC/MSGERC Consensus Definitions (Donnelly 2020)**

Probable Invasive Pulmonary Aspergillosis		
<p>At least one of the following:</p> <ul style="list-style-type: none"> <li>- ANC &lt;500 cells/<math>\mu</math>L for &gt;10 days and temporally related to the onset of IPA;</li> <li>- Hematologic malignancy (refers to an active malignancy, in receipt of treatment for this malignancy, and those in remission within the past 5 years)</li> <li>- Receipt of an allogeneic stem cell transplant</li> <li>- Receipt of a solid organ transplant</li> <li>- Prolonged use of corticosteroids at a dose of <math>\geq 0.3</math> mg/kg prednisone equivalent for <math>\geq 3</math> weeks in the 60 days preceding the diagnosis of IPA</li> <li>- Treatment with other recognized T-cell immunosuppressants during the 90 days preceding the diagnosis of IPA (such as calcineurin inhibitors, tumor necrosis factor-<math>\alpha</math> blockers, lymphocyte specific monoclonal antibodies, immunosuppressive nucleoside analogues)</li> <li>- Treatment with recognized B-cell immunosuppressants during the 90 days preceding the diagnosis of IPA (such as Bruton's tyrosine kinase inhibitors, e.g., ibrutinib)</li> <li>- Inherited severe immunodeficiency (such as chronic granulomatous disease, STAT 3 deficiency, or severe combined immunodeficiency)</li> <li>- Acute graft-versus-host disease grade III or IV involving the gut, lungs, or liver that is refractory to first-line treatment with steroids.</li> </ul>		
<b>AND:</b>		
<b>Clinical Features</b>	<b>CT Scan</b>	<p>Pulmonary aspergillosis with the presence of at least 1 of the following 4 patterns on CT:</p> <ul style="list-style-type: none"> <li>- Dense, well-circumscribed lesions(s) with or without a halo sign; OR</li> <li>- Air crescent sign; OR</li> <li>- Cavity; OR</li> <li>- Wedge-shaped and segmental or lobar consolidation</li> </ul>
	<b>Bronchoscopy</b>	<p><b>OR:</b></p> <p>The presence of tracheobronchitis or anastomotic infection seen on bronchoscopy:</p> <ul style="list-style-type: none"> <li>- tracheobronchial ulceration, nodule, pseudomembrane, plaque, or eschar</li> </ul>
<b>AND:</b>		
<b>Mycological evidence</b>	<b>Culture</b>	<p>At least 1 positive culture for <i>Aspergillus</i> spp. (sputum, BAL, bronchial brushings, or aspirate)</p> <p><b>OR:</b></p>

<b>Study Number: PC_ASP_006</b>	Compound No.: PC945
Protocol	Amendment 5

**Microscopy detections of fungal elements**

Indicating presence of *Aspergillus* spp. (sputum, BAL, bronchial brushings, or aspirate)

**Galactomannan antigen – ELISA<sup>a, b</sup>**
**OR:**

Any 1 of the following:

Serum:

- Single serum or plasma: **CCICCI** ODI for subjects with a breakthrough infection i.e., while receiving mold-active prophylaxis or treatment or within 7 days of discontinuing mold-active prophylaxis or treatment)
- Two separate serum samples with values each **CCI** ODI (not applicable for subjects with a breakthrough infection)

BAL fluid:

- Single BAL fluid sample **CCICCI** ODI for subjects with a breakthrough infection i.e., while receiving mold-active prophylaxis or treatment or within 7 days of discontinuing mold-active prophylaxis or treatment)

Combination of serum or BAL fluid:

- Single serum or plasma: **CCICCCICCI** ODI (not applicable for subjects with a breakthrough infection)

**OR:**

Any 1 of the following:

Plasma, serum, or whole blood:

- 2 or more consecutive positive PCR tests (taken on separate days)

BAL fluid:

- 2 or more duplicate PCR tests positive (from the same sample)

Combination of plasma/serum/whole blood and BAL:

- At least 1 PCR test positive in plasma, serum, or whole blood and 1 PCR test positive in BAL fluid

<sup>a</sup> Using the Bio-Rad Platelia *Aspergillus* enzyme immunoassay

<sup>b</sup> The VirCell VirClia *Aspergillus* chemiluminescent immunoassay may be used instead of the BioRad Platelia assay in exceptional cases with prior written approval from the Sponsor. According to the manufacturer of the VirClia assay, an index value >0.2 is considered a positive result.

<b>Study Number: PC_ASP_006</b>	Compound No.: PC945
Protocol	Amendment 5

### 16.6.2. 2010 ISHLT Consensus Statements for **Inclusion Criterion 6** (adapted for IPA in Lung Transplant Recipients)

**Table 10: *Aspergillus* Fungal Pneumonia in Cardiothoracic Transplant (Husain 2011, adapted)**

Syndrome <sup>a</sup>	Signs/symptoms	Radiology	Laboratory
<p>Pneumonia</p> <p><b>Proven:</b></p> <p>Histology (biopsy showing histologic evidence of parenchymal invasion by fungal hyphae) or positive culture from sterile tissue <i>ALONE</i>; OR with sign/symptoms + radiology + laboratory</p> <p><b>Probable:</b></p> <p>Sign/symptoms + radiology + laboratory + negative histology</p>	<p>At least one of the following:</p> <ul style="list-style-type: none"> <li>Fever &gt;38°C OR hypothermia &lt;36.5°C with no other recognized cause</li> <li>Leukopenia (&lt;4,000 WBC/mm<sup>3</sup>) OR leukocytosis (≥12,000 WBC/mm<sup>3</sup>)</li> <li>New onset of purulent sputum OR</li> <li>Change in character OR quantity of sputum OR respiratory secretions suctioned</li> <li>New-onset or worsening cough, dyspnea, tachypnea, or pleural rub, rales or bronchial breath sounds</li> <li>Worsening gas exchange (O<sub>2</sub> desaturation, PaO<sub>2</sub>/ FiO<sub>2</sub> ≤240, increased oxygen requirements or increased ventilation demand)</li> <li>Pleural effusion</li> </ul>	<p>Chest radiograph with:</p> <ul style="list-style-type: none"> <li>New or progressive and persistent infiltrate</li> <li>Consolidation</li> <li>Cavitation</li> <li>Nodules</li> </ul> <p>OR CT scan with at least one of the following<sup>b</sup>:</p> <ul style="list-style-type: none"> <li>New or progressive and persistent infiltrate</li> <li>Consolidation</li> <li>Cavitation</li> <li>Nodules</li> </ul>	<p>Single positive culture for <i>Aspergillus</i> BAL/blood OR</p> <p>single positive PCR for <i>Aspergillus</i> BAL/blood OR</p> <p>positive galactomannan by ELISA<sup>c, d</sup> (CCI ODI) in the BAL OR</p> <p>at least TWO positive sputum cultures/PCRs of <i>Aspergillus</i></p>

<sup>a</sup> In the absence of biopsy categorize as probable: In the presence of histologic findings of both acute rejection and fungal invasion it should be classified as acute rejection with proven fungal infection.

<sup>b</sup> The presence of mosaic appearance and ground-glass opacity may represent development of bronchiolitis obliterans syndrome or obliterative bronchiolitis.

<sup>c</sup> ELISA assay required is Bio-Rad Platelia *Aspergillus* enzyme immunoassay

<sup>d</sup> The VirCell VirCilia *Aspergillus* chemiluminescent immunoassay may be used instead of the BioRad Platelia assay in exceptional cases with prior written approval from the Sponsor. According to the manufacturer of the VirCilia assay, an index value CCI is considered a positive result.

### 16.6.3. Assessment of Overall Response

**Table 13: Classification and Criteria for the Assessment of Overall Response (adapted from [Segal, 2008](#))**

	Complete	Partial	Stable	Worsening of Disease	Not Applicable
<b>Survival status</b>	Alive	Alive	Alive	Alive	
	AND	AND	AND	AND	
<b>Clinical or Bronchoscopy (where applicable)</b>	Resolution of all symptoms and signs attributable to IPA	Improvement of symptoms and signs attributable to IPA with no worsening of any signs and symptoms and no new symptoms attributable to IPA noted <sup>1, 2</sup>	Minor or no improvement in attributable symptoms and signs of disease	Worsening clinical symptoms or signs of disease	No attributable signs and symptoms present at baseline and no symptoms attributable to IA developed post baseline; or  Unable to determine due to missing data
	OR	OR	OR	OR	OR
	Complete resolution of IPA-attributable abnormalities on bronchoscopy	Significant improvement of IPA-attributable abnormalities on bronchoscopy	Minor or no improvement of IPA-attributable abnormalities on bronchoscopy	Worsening of IPA-attributable abnormalities on bronchoscopy	Unable to determine due to missing data
	AND	AND	AND	AND	

Study Number: PC_ASP_006	Compound No.: PC945
Protocol	Amendment 5

<b>Radiological</b>	Resolution of radiological lesion(s); persistence of only a scar or postoperative changes	At least 25% reduction in diameter of radiological lesion(s) <sup>1</sup>	Radiological stabilization (defined as a 0%–25% reduction in the diameter of the lesion)	New sites of disease or radiological worsening of pre-existing lesions	No post-baseline radiology available for subject with baseline evidence of radiological disease (unless the assessment was not clinically indicated), or  Unable to determine due to missing data; or  Subject has anastomotic or tracheobronchial disease with no abnormalities visible on CT scan or chest X-ray attributable to IPA
	AND	AND	OR	OR	
<b>Mycological<sup>7</sup></b>	Documented clearance of infected sites (i.e., culture or galactomannan <sup>5,6,7</sup> or PCR negative) that are accessible to repeated sampling (e.g., blood, sputum or BAL fluid/brushings/histology) <sup>4</sup>	Documented clearance of infected sites (i.e., culture or galactomannan <sup>5,6,7</sup> or PCR negative) that are accessible to repeated sampling (e.g., blood, sputum or BAL fluid/brushings/histology) <sup>3,4</sup>	Persistent detection of <i>Aspergillus</i> spp. (e.g., culture, blood or BAL fluid galactomannan positive by ELISA <sup>5</sup> CCI [REDACTED] CCICCCICCCI CCICCCICCCI CCICCCICCCI ODI) or <i>Aspergillus</i> PCR positive (blood, BAL fluid, or sputum) or histological presence of invasive hyphae in infected sites)	Persistent detection of <i>Aspergillus</i> spp. (e.g., culture, blood or BAL fluid galactomannan positive by ELISA <sup>5</sup> CCI [REDACTED] CCICCCICCCI CCICCCICCCI CCICCI [REDACTED] DI) or <i>Aspergillus</i> PCR positive (blood, BAL fluid, or sputum) or histological presence of invasive hyphae in infected sites)	No mycological evidence available at baseline; or  Unable to determine due to missing data <sup>4</sup>

<b>Study Number: PC_ASP_006</b>	Compound No.: PC945
Protocol	Amendment 5

1. Clear evidence of a radiological response (reduction in diameter by at least 25% with no new sites of disease) should be given more weight than subjective, nonspecific, or difficult-to-quantify symptoms or signs of disease. Thus, in the scenario of fungal pneumonia, we suggest that radiological improvement with persistence of fever or cough should be scored as a partial response.
2. Because radiological improvement often lags behind clinical improvement, radiological stabilization (0-25% reduction in the diameter of the lesion) and resolution of all attributable symptoms and signs of disease can also be equated with a partial response.
3. Cases of radiological stabilization with a biopsy of an infected site (e.g., lung biopsy) showing no evidence of hyphae and negative culture results can be equated with a partial response
4. If mycology data or information are missing due to further diagnostic testing not being clinically indicated and not missing due to other reasons, eradication will be presumed
5. Using the Bio-Rad Platelia *Aspergillus* galactomannan enzyme immunoassay
6. Using the VirCell VirCilia *Aspergillus* galactomannan chemiluminescent immunoassay
7. Using the IMMY sōna *Aspergillus* galactomannan Lateral Flow Assay with an automated cube reader
8. While a positive galactomannan can be used to confirm that the subject's refractory clinical state is due to persistent *Aspergillus* infection, in situations where the galactomannan has decreased meaningfully but remains positive, Investigators should use clinical judgement (e.g., consider obtaining additional serum or BAL galactomannan levels of possible) to determine whether the subject remains appropriate for admission into the study and wherever possible should discuss the case with the sponsor's Medical Monitor prior to randomization.

Study Number: PC_ASP_006	Compound No.: PC945
Protocol	Amendment 5

#### 16.6.4. Definition of Adequate Antifungal Therapy

Prior to randomization subjects must have been treated with any one, or combination, of the medications below for at least 7 (for progressive disease) to 14 (for stable disease) days to be considered refractory to treatment. Adequate antifungal therapy is defined as mold-active treatment at the approved dose(s). For certain triazole medications, it is recommended that drug levels are obtained when clinically indicated and/or as per local (country/site) usual practice, while following the recommendations within the ESCMID-ECMM-ERS guideline for the diagnosis and management of *Aspergillus* diseases ([Ullmann, 2018](#)).

## 16.7. Appendix 7: Eligibility Assessment References

### 16.7.1. Karnofsky Score

The Karnofsky Performance Scale Index allows subjects to be classified as to their functional impairment. The lower the Karnofsky score, the worse the survival for most serious illnesses [Crooks, 1991, Hollen, 1994; O'Toole, 1991; Oxford Textbook of palliative medicine, 1993; Schag, 1984].

**Table 16: Karnofsky Performance Status Scale Definitions Rating Criteria (%)**

Able to carry on normal activity and to work; no special care needed	100	Normal no complaints; no evidence of disease
	90	Able to carry on normal activity; minor signs or symptoms of disease
	80	Normal activity with effort; some signs or symptoms of disease
Unable to work; able to live at home and care for most personal needs; varying amount of assistance needed	70	Cares for self; unable to carry on normal activity or to do active work
	60	Requires occasional assistance, but is able to care for most of his personal needs
	50	Requires considerable assistance and frequent medical care
Unable to care for self; requires equivalent of institutional or hospital care; disease may be progressing rapidly	40	Disabled; requires special care and assistance
	30	Severely disabled; hospital admission is indicated although death not imminent
	20	Very sick; hospital admission necessary; active supportive treatment necessary
	10	Moribund; fatal processes progressing rapidly
	0	Dead

<b>TOTAL APACHE-II Score</b>										

GLASGOW COMA SCALE (Teasdale, 2015)		
Parameter	Response	Points Assigned (please circle)
Eyes Open	Spontaneously	4
	To verbal command	3
	To pain	2
	No eye opening	1
	Not testable*	NT
Best Motor Response	Obeys command	6
	To painful stimulus:	
	Localizes pain	5
	Withdrawal from pain	4
	Flexion to pain	3
	Extension to pain	2
	No motor response	1
	Not testable*	NT
Best Verbal Response	Oriented	5
	Confused	4
	Inappropriate words	3
	Incomprehensible sounds	2
	No verbal response	1
	Not testable / intubated*	NT
TOTAL GCS =		

\* Individual components may be not testable due to any of the following (note this is not a comprehensive list):

- Eye: local injury and/or edema
- Verbal: intubation
- All (eye, verbal, motor): sedation paralysis, and ventilation eliminating all responses.

#### CHRONIC HEALTH DEFINITIONS

Organ insufficiency or immuno-compromised state evident prior to this hospital admission and are consistent with the following criteria:

**LIVER:** Biopsy-proven cirrhosis and documented portal hypertension; prior episodes of upper GI bleeding attributed to portal hypertension; or prior episodes of hepatic failure/encephalopathy/coma

**CARDIOVASCULAR:** New York Heart Association Class IV

**RESPIRATORY:** Chronic restrictive, obstructive, or vascular disease resulting in severe exercise restriction (i.e., unable to climb stairs or perform activities of daily living or household duties; or documented chronic hypoxia, hypercapnia, secondary polycythemia, severe pulmonary hypertension (>40 mmHg), or ventilator dependency

**RENAL:** Receiving chronic dialysis

**IMMUNO-COMPROMISED:** The patient has received therapy that suppresses resistance to infection (i.e., immuno-suppressive treatment, chemotherapy, radiation, long term or recent high dose steroids, or has a disease that is sufficiently advanced to suppress resistance to infection (i.e., leukemia, lymphoma, AIDS)

---	------------------------------------

#### **16.7.4. Definition of Women of Childbearing Potential**

According to the Clinical Trials Coordination Group (CTCG) document on the recommendations related to contraception and pregnancy testing in clinical trials (Version 1,2; 07 March 2024), a woman is considered of childbearing potential (WOCBP), i.e., fertile, following menarche and until becoming post-menopausal unless permanently sterile.

Permanent sterilization methods include hysterectomy, bilateral salpingectomy, and bilateral oophorectomy.

A postmenopausal state is defined as no menses for 12 months without an alternative medical cause. A high follicle stimulating hormone (FSH) level in the postmenopausal range may be used to confirm a post-menopausal state in women not using hormonal contraception or hormonal replacement therapy. However, in the absence of 12 months of amenorrhea, a single FSH measurement is insufficient.
