2. Abstract

This is a non-randomized, non-interventional study that is part of the RCT DUPLICATE initiative (www.rctduplicate.org) of the Brigham and Women's Hospital, Harvard Medical School. It is intended to emulate, as closely as is possible in healthcare insurance claims data, the SOUL trial described below. Although many features of the trial cannot be directly replicated in healthcare claims, key design features, including outcomes, exposures, and inclusion/exclusion criteria, were selected to proxy those features from the trial. Randomization cannot be achieved in healthcare claims data but was proxied through a statistical balancing of measured covariates according to standard practice. Investigators assume that the RCT provides the reference standard treatment effect estimate and that failure to replicate RCT findings is indicative of the inadequacy of the healthcare claims data for emulation for a range of possible reasons and does not provide information on the validity of the original RCT finding.

The SOUL trial, which is a superiority trial to evaluate the effect of oral semaglutide versus placebo on MACE outcomes (CV death, nonfatal MI, or nonfatal stroke) among individuals with type 2 diabetes (T2DM) and established atherosclerotic cardiovascular disease (ASCVD) and/or chronic kidney disease (CKD).

The database study designed to emulate SOUL will be a new-user active comparative study, where we compare the effect of oral semaglutide versus sitagliptin on MACE outcome among patients with T2DM and with established ASCVD and/or CKD. Sitagliptin was selected to act as an active-comparator proxy for placebo. Sitagliptin and the class of dipeptidyl peptidase-4 (DPP-4) inhibitors have been demonstrated not to have an effect on MACE in a series of RCTs, and they are used in similar stages of disease/line of therapy as semaglutide, as well as being similarly costly.

The study will use three data sources: Optum Clinformatics, Merative Marketscan, and Medicare.

Optum: Study period between 20th Sept 2019 – 29th February 2024

Marketscan: Study period between 20th Sept 2019 - 31st Dec 2022

Medicare: Study period between 20th Sept 2019 – 31st Dec 2020

7 th December 2024	3	6.4.3	Added Nursing home admission as one of the censoring reason.	This censoring reason was left out of the protocol in error, and we are amending it to be consistent with our other protocols
16 th December 2024	3.1	Appendices	Added the FDA protocol review dates for the first and second feasibility	The protocol review dates by the FDA were not documented in the previous version.
10 th March 2025	4	Appendices	Covariate code algorithms for Pap smear, COPD, pneumonia, and diabetic nephropathy were corrected.	Errors in the implementation of covariate code algorithms for Pap smear, COPD, pneumonia, and diabetic nephropathy were identified.
17 th April 2025	5	Negative control outcomes	Added Hernia and Lumbar radiculopathy	Given the ongoing discussion around semaglutide and its potential association with non-arteritic anterior ischemic optic neuropathy (NAION) as a negative control outcome, we

				wanted to include alternative negative control outcomes.

4. Rationale and background

The purpose of this protocol is to specify the emulation of the SOUL trial ([NCT03914326](#)). Oral semaglutide became available on September 20th, 2019.¹ The trial enrolled 9,650 participants between June 17, 2019 – March 24, 2021. The trial design is event-driven with an expected 3.5 to 5 years follow-up period and an assumed outcome rate of 3.5% in the placebo arm. The trial uses 90% power with a 0.025 type 1 error rate to confirm superiority.^{2,3}

5. Research question and objectives

Table 1 Primary and secondary research questions and objective

A. Primary research question and objective

Objective:	To evaluate the comparative safety effect of oral semaglutide versus sitagliptin (proxy for placebo) on MACE outcomes (CV death, nonfatal MI, or nonfatal stroke) in patients with diabetes and established CV or kidney disease
Hypothesis:	We hypothesize that semaglutide will be superior to sitagliptin at preventing MACE
Population (<i>mention key inclusion-exclusion criteria</i>):	The study population included patients aged 50 years or older with type 2 diabetes (T2DM) and established atherosclerotic cardiovascular disease (ASCVD) and/or chronic kidney disease (CKD). Patients were excluded if they had recent MI, stroke, hospitalization for unstable angina or transient ischemic attack, class IV heart failure, prior treatment with GLP-1, history of multiple endocrine neoplasia type 2, medullary thyroid cancer, pancreatitis, bariatric surgery, current or recent pregnancy, history of non-melanoma skin cancer, dialysis of severe renal impairment, proliferative retinopathy or maculopathy requiring treatment, history of diabetic ketoacidosis.
Exposure:	Oral semaglutide
Comparator:	Sitagliptin
Outcome:	Major adverse cardiac event (MACE), including myocardial infarction, stroke, and all cause death

Time (when follow up begins and ends):	1 days after cohort entry date until the first of outcome, disenrollment, end of study period, 365 days after cohort entry date, discontinuation (30 days grace and risk window), switch between the arms, start of any other GLP1 agonists (including injectable semaglutide)
Setting:	Patients may be treated in outpatient settings. The outcome will be measured from inpatient hospitalizations and/or death.
Main measure of effect:	Hazard ratio

B. Secondary research question 1 and objective

Objective:	To evaluate the effect of oral semaglutide versus sitagliptin on negative control outcomes, including A. cataract surgery, B. hernia and C. lumbar radiculopathy
Hypothesis:	We hypothesize that semaglutide will not have a different effect from sitagliptin.
Population (mention key inclusion-exclusion criteria):	<p>The study population included patients aged 50 years or older with type 2 diabetes (T2DM) and established atherosclerotic cardiovascular disease (ASCVD) and/or chronic kidney disease (CKD).</p> <p>Patients were excluded if they had recent MI, stroke, hospitalization for unstable angina or transient ischemic attack, class IV heart failure, prior treatment with GLP-1, history of multiple endocrine neoplasia type 2, medullary thyroid cancer, pancreatitis, bariatric surgery, current or recent pregnancy, history of non-melanoma skin cancer, dialysis of severe renal impairment, proliferative retinopathy or maculopathy requiring treatment, history of diabetic ketoacidosis. In addition, patients were excluded for baseline hernia or lumbar radiculopathy when the negative outcome was hernia or lumbar radiculopathy respectively.</p>
Exposure:	Oral semaglutide
Comparator:	Sitagliptin
Outcome:	Separate analyses were run for cataract surgery, hernia, and lumbar radiculopathy
Time (when follow up begins and ends):	1 days after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (30 days grace and risk window), switch between the arms, start of any other GLP1 agonists (including injectable semaglutide)

Setting:	Patients may be treated in outpatient settings. The outcome will be measured using procedure codes in an outpatient setting.
Main measure of effect:	Hazard ratio

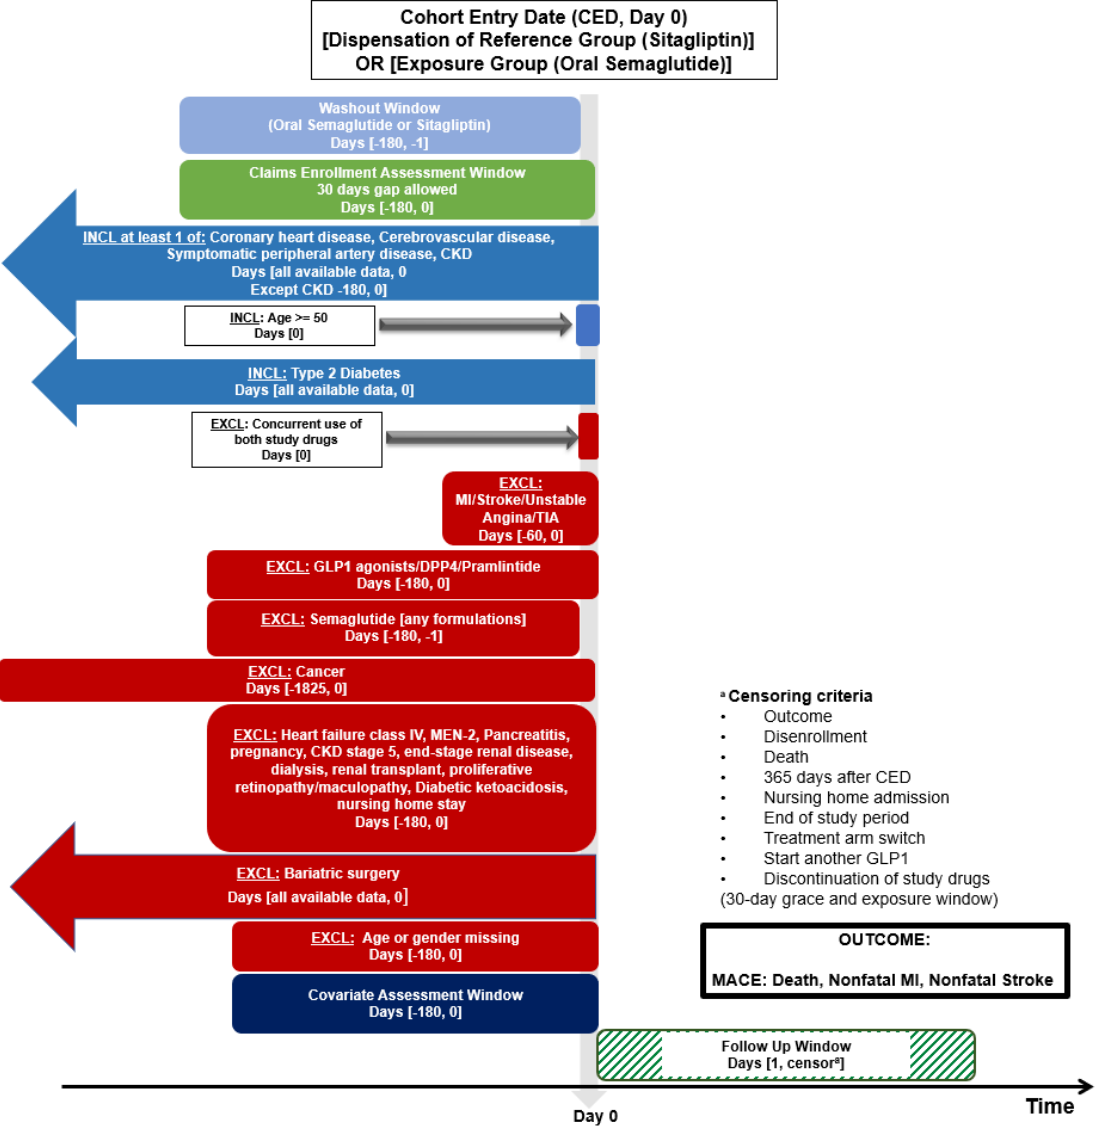

6. Research methods

6.1. Study design

Research design (e.g. cohort, case-control, etc.): New user active comparator cohort study

Rationale for study design choice: The new user active comparator design is a powerful design that may be able to address confounding by indication. It accomplishes this, in large part, through judicious selection of an appropriate active-comparator group.^{4,5} While selection of an appropriate comparator in the design phase is crucial, cohort studies often require additional adjustment of measurable confounders. A common method for adjusting for confounding is via a propensity score (PS).

6.2. Study design diagram

Note: The CV disease inclusion may include acute MI codes but any acute MI in the 60 days is excluded. History of heart failure is an inclusion criterion, but heart failure class IV is excluded.

6.3. Setting

6.3.1 Context and rationale for definition of time 0 (and other primary time anchors) for entry to the study population

Time 0 in the database study was defined to emulate randomization to oral semaglutide versus sitagliptin in the clinical trial design. See appendix tables 1 and 2a for operational definitions and detailed code algorithms.

6.3.2 Context and rationale for study inclusion criteria:

Study inclusion criteria were defined to emulate the inclusion criteria for the trial. See appendix tables 1 and 2 for operational definitions and detailed code algorithms. See appendix tables 1 and 2b for operational definitions and detailed code algorithms.

A flowchart of the study cohort assembly is provided in Appendix 3.

6.3.3 Context and rationale for study exclusion criteria

Study exclusion criteria were defined to emulate the exclusion criteria for the trial. See appendix tables 1 and 2 for operational definitions and detailed code algorithms. See appendix tables 1 and 2c for operational definitions and detailed code algorithms.

A flowchart of the study cohort assembly is provided in Appendix 3.

6.4. Variables

6.4.1 Context and rationale for exposure(s) of interest

The exposure and comparator were defined to emulate the agents compared for the trial, oral semaglutide versus sitagliptin. See appendix tables 1 and 2a for operational definitions and detailed code algorithms.

Algorithm to define duration of exposure effect:

Assuming the effect of the drug lasts for 30 days after the days' supply, we allow 30 days gap between the dispensation (grace period) and also add 30 days at the end of days' supply of dispensation (exposure risk window).

6.4.2 Context and rationale for outcome(s) of interest

The primary outcome for the database study was defined to emulate the primary outcome for the trial of MACE. In the trial, this was a combination of myocardial infarction, stroke, and cardiovascular death. In our emulation, due to inability to capture cause of death, our modified MACE outcome was measured as inpatient myocardial infarction, inpatient stroke, and all-cause mortality. See appendix tables 1 and 2d for operational definitions and detailed code algorithms. Optum includes death information from the inpatient discharged dead status, social security death master file, and deaths scraped from obituaries or other sources. MarketScan includes information from the inpatient discharged dead status up until 2016. Medicare includes information from the inpatient discharged dead

status, NDI cause of death, and social security death master file. The positive predictive value for the myocardial infarction outcome algorithm using ICD-9 codes was observed to be 88.4% and 94% in validation studies.^{6,7} The PPV for the ischemic stroke outcome algorithm was 88% and 95% in validation studies using ICD9 codes.^{6,8} The ICD9 code algorithms were mapped to ICD10 codes and reviewed by a clinician, but the performance of the mapped codes was not further validated.

Secondary outcomes from the trial that will be evaluated include components of the MACE outcome including:

- 1. Myocardial infarction
- 2. Stroke
- 3. All cause Death

Control outcomes of interest include:

- 1. Cataract surgery. This is a negative control outcome where no difference in effect is expected for semaglutide versus sitagliptin.
- 2. Hernia. This is a negative control outcome where no difference in effect is expected for semaglutide versus sitagliptin.
- 3. Lumbar radiculopathy. This is a negative control outcome where no difference in effect is expected for semaglutide versus sitagliptin.

6.4.3 Context and rationale for follow up

Both on-treatment (OT) and intention-to-treat (ITT) analyses will be conducted. Adherence in clinical practice databases is expected to be much worse than in the trial, Therefore the OT analysis will be the primary analysis. The OT analysis targets the relative hazard of outcomes while on treatment and may more closely emulate the effect observed in highly adherent trial participants.

End of exposure (specify operational details, e.g. stockpiling algorithm, grace period)	Yes	30 days grace window and 30 days risk window
Date of add to/switch from exposure (specify algorithm)	Yes	Date of augmentation or switching from an exposure to a comparator and vice versa.
Other date (specify)	Yes	Nursing home admission, Censor upon starting any other GLP1 agonists including injectable semaglutide.

6.4.4 Context and rationale for covariates (confounding variables and effect modifiers, e.g. risk factors, comorbidities, comedications)

We identified a series of covariates that were likely confounders due to being strong risk factors for the primary outcome that were associated with choice of treatment. These include demographics, disease severity related variables, comorbid conditions, comedications, frailty, healthcare utilization and markers of health seeking behaviour.

6.5. Data analysis

6.5.1 Context and rationale for analysis plan

The study will use a propensity score (PS) 1:1 nearest neighbor matching with a caliper of 0.01 on the propensity score scale. The PS will be estimated as the probability of initiating oral semaglutide versus sitagliptin given the baseline patient characteristics using multivariable logistic regression models. As diagnostics for PS models, the study will evaluate covariate balance using standardized differences and c-statistics post-matching. The study will estimate the hazard ratio for oral semaglutide versus sitagliptin on MACE outcome in the matched population using a Cox proportional hazards model.

Table 4. Primary, secondary, and subgroup analysis specification

A. Primary analysis

Hypothesis:	Oral semaglutide might decrease risk of MACE outcome compared to sitagliptin in those with diabetes and established CV disease
Exposure contrast:	Oral semaglutide vs sitagliptin
Outcome:	MACE

B. Secondary Analysis 1

Hypothesis:	Oral semaglutide has no effect on risk of negative control outcomes compared to sitagliptin. Negative control outcomes include: A. cataract surgery, B. hernia, C. lumbar radiculopathy
Exposure contrast:	Oral semaglutide vs sitagliptin
Outcome:	Separate analyses were run for each negative control outcome, including cataract surgery, hernia and lumbar radiculopathy

Analytic software:	Aetion, STATA 17, SAS 9.4, R.4.4.0
Model(s): (provide details or code)	Outcome model: Cox proportional hazards Follow-up time*status(0) = exposure

Table 5. Sensitivity analyses – rationale, strengths and limitations

	What is being varied? How?	Why? (What do you expect to learn?)	Strengths of the sensitivity analysis compared to the primary	Limitations of the sensitivity analysis compared to the primary
Re-weighted population distribution	We will re-weight the population distribution of the pooled database study cohorts to reflect that of the RCT if that information is made public prior to publication of our results.	We will learn about potential effect modification due to different distributions of key characteristics such as age/sex in the RCT versus the database study.	The population distributions will be more aligned.	The measurement of these population characteristics may be measured differently in the RCT vs database study, with different levels of specificity and sensitivity.
Negative control outcomes, including cataract surgery, hernia, lumbar radiculopathy	We evaluate negative control outcomes of cataract surgery, hernia, and lumbar radiculopathy, where no causal effect is expected from semaglutide or sitagliptin	We will evaluate the potential impact of residual confounding on this outcome for which there is not expected to be a causal effect	The evaluates the robustness of the interpretation of the primary analysis by evaluating the potential magnitude of unmeasured confounding	This analysis assumes that the confounding structure is the same or similar for the negative control outcome as the outcome of interest
PS-adjustment method	Instead of 1:1 PS matching, we will use PS fine stratification weights. The analytic cohort will be asymmetrically trimmed at 1%	Use of fine-stratification weights will have more power than 1:1 matching	More power to estimate ATT	More complex to understand than simple 1:1 match, potentially less closely balanced

of the tails. The analytic cohort will be weighted to estimate the average effect in the treated (ATT). Each exposed patient will be assigned a weight = 1. Each comparator patient will be assigned a weight =

$$\frac{\left(\frac{N_{\text{exposed in strata } i}}{N_{\text{total exposed}}} \right)}{\left(\frac{N_{\text{unexposed in strata } i}}{N_{\text{total unexposed}}} \right)}$$

Apply benchmark, expand, calibrate (BenchExCal) sensitivity and tipping point analysis	We will use the observed difference in result from emulation of SUSTAIN6 to recalibrate the result from the database study emulation of PIONEER6. We will conduct a tipping point analysis with a range of plausible estimates of the expected difference.	We expect to learn about the performance of BenchExCal in an example where we emulate an RCT for an expanded indication and an RCT result for the expanded indication is available.	The analysis will calibrate the primary result based on expected differences due to bias and/or design emulation differences and propagate uncertainty regarding the impact of these factors into the frequentist primary result	The ability to appropriately calibrate the result depends on how “close” the clinical context is between the initial and expanded indication. The approach assumes that the net effect of bias and design emulation differences is the similar.

6.6. Data sources

6.6.1 Context and rationale for data sources

Reason for selection: The study will be conducted in 3 US health care claims databases: Optum Clinformatics (2019-Feb 2024), Merative Marketscan (2019-2022) and Medicare (a sample that includes all patients with diabetes or heart failure diagnosis, 2019-2020).

Strengths of data source(s): Each data source contains deidentified, longitudinal, date-stamped information on patient enrollment, demographics, inpatient/outpatient diagnosis and procedures, admission and discharge dates, and medication dispensation. The death data is captured in the Optum database from inpatient discharge status, social security death master file, and deaths scraped from obituaries or other sources. The death data in MarketScan is captured from the social security death master file and inpatient discharge status. It is recognized that the social security death master file has high specificity and positive predictive value for deaths. While this data resource has under captured deaths since 2011, the capture of deaths is not expected to be differential between compared exposure groups. The death data is captured in the Medicare database from inpatient discharge status, and social security death master file.¹³⁻¹⁵

Limitations of data source(s): Patient healthcare encounters are only observable when they are enrolled in an insurance plan that contributes to the database. Patients may change insurance plans for multiple reasons. Both Optum Clinformatics and Merative MarketScan are primarily employer based insurance databases where patients may disenroll with job changes. Patients in Medicare may move in and out of fee-for-service plans. We are excluding person-time in health maintenance organization (HMO) plans due to concerns about the completeness of capture of diagnoses and procedures. This means that we require

patients to be enrolled in Medicare parts AB and D during the baseline assessment window and censor patients if they switch to part C. In claims data, dispensing data for inpatient medication is unavailable. Diagnoses reflect billing practices, therefore algorithms (preferably validated) are needed for accurate phenotyping of patient conditions. Services that are not covered by insurance do not appear in the data. The trial evaluated cardiovascular deaths, however we will evaluate all cause death in the emulation because most deaths in this cohort of patients at high cardiovascular risk will be related to cardiovascular reasons, the cause of death is not recorded for databases not linked to NDI, and the performance of NDI at identifying cardiovascular causes of death may be suboptimal.¹⁵

Data source provenance/curation:

Information about Optum Clinformatics and Merative MarketScan can be found in data dictionaries and user guides that are provided to clients. Information about Medicare data provenance and curation can be found on the ResDac website.¹⁶

6.7. Data management

Tracking data: The Data Use Agreement (DUA) Custodian (Principal Investigator) and the Division Operations Manager (Winta Tekle) are responsible for receiving and creating a record of new data associated with the given request. The Operations Manager is responsible for all indexing and archiving of documents and

electronic media related to data that the Division receives and will log data location, data contents, and associated DUA and Institutional Review Board (IRB) numbers in the Division's centralized tracking system.

Handling and storage: In-scope data will be stored utilizing Mass General Brigham approved information systems – i.e., Division servers and Mass General Brigham network storage.

Archiving: Data retention and any removal will be executed by the Division Operations Manager (Winta Tekle) and Data Manager (Todd MacGarvey). The Division follows Mass General Brigham enterprise record retention policies and follow the terms of the agreement through which the in-scope data was received.

Information security: The Division follows Mass General Brigham's Enterprise Information Security Program (EISP). The EISP helps by providing assurance that Mass General Brigham information and information systems are protected from unauthorized access, use, disclosure, duplication, modification, or destruction in order to maintain their confidentiality, integrity, and availability. To that end, the EISP policies, standards and procedures create an information security framework that is aligned with the recommendations of the International Organization for Standardization's (ISO) publication 27001 and the National Institute of Standards and Technology's (NIST) publication 800-53 Family of Controls and MGB regulatory and legal requirements (as a HIPAA covered entity).

Mass General Brigham workforce members are required to complete new workforce privacy and information security training upon hire and annually thereafter. Refresh training is provided as appropriate. Mass General Brigham workforce members are required to review and sign a Confidentiality Agreement upon hire and annually thereafter. Additionally, we follow Enterprise Information Security and Privacy policies, including Managing Workforce Members Information Security Responsibilities Policy, which was developed to help assure that Mass General Brigham workforce members are competent and eligible to support the information security responsibilities associated with their role. Mass General Brigham workforce, including Division staff, are required to comply with Enterprise Information Security and Privacy Policies.

Facilities: The research team uses a highly secure, state-of-the-art, computing facility housed at Mass General Brigham's Corporate Data Centers in Needham and Marlborough, Massachusetts as well as Amazon Web Services (AWS). We maintain redundant storage for maximal data integrity and high-speed data access.

The Division uses Mass General Brigham corporate provisioned servers to analyze and store data in connection with this project. There are strict access controls enforced by technical means to ensure that only study staff who have been approved to conduct data analyses and contracted data engineers are able to access data (e.g., Mass General Brigham Authentication (Active Directory) utilized; auditing, logging, and monitoring enabled; firewalls enabled; etc.). All Division servers used in this study are accessible to only authorized staff only through the MGB network and utilizing VPN as appropriate (i.e., users must be on the network and logged into VPN to access). Mass General Brigham has a network information security monitoring team and in-scope servers are enrolled in enterprise security tools (e.g., vulnerability scanning service, antivirus, etc.).

The Division also uses AWS. In-scope AWS services / resources have undergone review and assessment by Mass General Brigham's Information Security Risk Assessment Team/ InfoSec Risk Management Team as required and in alignment with NIST 800-30: Guide for Conducting Risk Assessments. In-scope AWS servers are for our exclusive use (reserved instances), are covered under our organization's Business Associate Agreement with AWS. In-scope servers are housed in anonymous facilities that are not branded as AWS facilities. Physical access is strictly controlled both at the perimeter and at building ingress points by professional security staff utilizing video surveillance, intrusion detection systems, and other electronic means.

Security attributes and controls for the Division's use of in-scope AWS in connection with this project include: encryption at rest and in transit (industry standard AES-256 encryption, SSL/TSL), anti-malware, latest OS updates and patches as well as anti-virus; multi-factor authentication (MFA), Identity and Access

Management, including SSO; auditing and logging; principle of least privilege, including for traffic and ports (e.g., deny all default configurations), use of VPC enabled Step functions, etc.; separation between environments; minimum necessary (out of the box AWS roles are not used as they can be overly permissive); all data would reside in the US domestic regions – use only US east HIPAA compliant region; performance monitoring enabled and reviewed as per internal processes; passwords compliant with enterprise password policy and, as appropriate, more protective password requirements; etc. Our Division's AWS use is also subject to ongoing evaluation and monitoring as well – e.g., vulnerability scanning and management, access review, etc.

A data file list will be maintained in Amazon S3 and tracked through Cloudtrail and Cloudwatch. Reporting of data file availability for any file stored in an S3 bucket will be controlled by MGB.

Amazon EC2, Amazon EBS, and Amazon VPC are integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in Amazon EC2, Amazon EBS, and Amazon VPC. CloudTrail captures all API calls for Amazon EC2, Amazon EBS, and Amazon VPC as events, including calls from the console and from code calls to the APIs. MGB IT/security staff have full access to CloudTrail to ensure that CloudTrail monitoring is available at all times. Amazon CloudWatch Events delivers a near-real-time stream of system events that describe changes in AWS resources. Amazon CloudTrail can log, continuously monitor, and retain account activity related to actions across the MGB AWS infrastructure. CloudTrail provides event history of MGB AWS account activity. This event history simplifies security analysis, resource change tracking, and troubleshooting and complies with requirements to ensure the data file inventory is controlled by MGB.

Backups: Backups are created using industry recognized Cryptographic mechanisms (e.g., 256-bit AES encryption) as appropriate and required. Data are backed up within the MGB network from the MGB Needham data center to the MGB Marlborough data center via replication/mirroring and volume-level snapshots. AWS Backup supports both instance-level backups as Amazon Machine Images (AMIs) and volume-level backups as separate snapshots based on the resource tags. AMIs allow MGB IT and security staff to create backups of all S3 and EC2 instances. This backup approach allows elimination of EC2 instances when access to CMS data files is no longer needed. Use of temporary instances will allow highest security control to be applied regarding for whom and when CMS data files are accessible.

In addition to the safeguards listed above, the Division follows enterprise privacy and information security policies and maintains internally procedures in connection with this project to safeguard the data in connection with this project as appropriate and required including: Physical Security and Environmental Controls for Electronic Information Policy; IT Access Control Standards for Users policy; Safeguarding Fax Copiers Printers Telephone Use and Pagers; Physical Removal and Transport of Protected Health Information and Personal Information policy, etc.

6.8. Quality control

Senior Programmers and Research Specialists perform QA/QC on raw or common data model converted data via SAS/R/Aetion software. The protocol will be iteratively developed and pre-specified data checks including feasibility counts and balance on baseline covariates will be conducted with outputs reviewed by both MGB and FDA team members. Team members will review code lists to ensure fidelity to intended algorithms.

6.9. Study size and feasibility

First feasibility assessment: Details of power calculations after applying eligibility criteria and matching on ages, sex and comorbidity score are available in appendix 4.

Second feasibility assessment: Details of power calculations after matching or weighting on all predefined propensity score variables are available in appendix 5. Propensity score distribution plots with c-statistics are available in appendix 6. Table 1 showing prevalence of baseline characteristics and standardized differences in distribution are available in appendix 7.

7. Limitation of the methods

As we are using secondary data and the data were not collected for research, some important variables may not be collected or will be measured imperfectly. We have selected validated algorithms when possible and we have created proxies for important variables that are not directly captured in the data to reduce confounding by unmeasured factors. One measurement difference is for the primary outcome, where for the RCT, MACE was defined as stroke, myocardial infarction, and cardiovascular death, whereas in our database study, it is defined as stroke, myocardial infarction, and all cause death.

When comparing results from an RCT to a database study that emulates the design, we assume that the findings from the single RCT are internally valid which is not guaranteed.

Although we plan to emulate the important features of each RCT as closely as possible in healthcare claims, there may be some elements of RCT design that are not emulable with a database study, which means that the RWE and RCT will address slightly different clinical questions. For example, in routine clinical care, adherence to treatment is typically not as high as it is in an RCT with strong measures in place to encourage adherence to the study protocol. This means that there is more discontinuation and short-term medication use in the patients identified in claims databases than trial participants.

Apparent agreement between RCT and database study results could occur if the effects of multiple factors (chance, emulation differences, bias) cancel each other out.

In order to complete the initial power analysis, a dummy outcome of a 90-day gap in database enrollment was used. This outcome is used to ensure that no information on the comparative risks of the outcomes of interest are available at this stage. We completed a 1:1 PS-matched comparative analysis using this outcome. The PS included only 3 covariates: age, sex, and combined comorbidity index. Power calculations are based on the formulas from Chow et al. (2008).

Optum: Study period between 20th Sept 2019 – 29th February 2024

D. Final Power Assessment (Step 3)

Based on 1:1 randomization and assuming an annulized placebo MACE rate of 3.5%, a true HR of 0.83, it was determined that total of 1225 first MACEs are required to confirm superiority with primary outcome of 90% power using a 1 sided type 1 error rate of 0.025
