2. Abstract

This is a non-randomized, non-interventional study that is part of the *Randomized Controlled Trials Duplicated Using Prospective Longitudinal Insurance Claims: Applying Techniques of Epidemiology* (RCT-DUPLICATE) initiative (www.rctduplicate.org) of the Brigham and Women's Hospital, Harvard Medical School. Randomized controlled trials (RCTs) have demonstrated cardiovascular benefits of the modern incretin therapies semaglutide and tirzepatide in selected populations. SUSTAIN-6 (NCT01720446) and SURPASS-CVOT (NCT04255433) showed reductions in cardiovascular events with semaglutide and tirzepatide among patients with T2DM at high cardiovascular risk, findings that were also replicated in clinical practice settings (NCT06659744, NCT07088718).[1–3] The REWIND trial (NCT01394952) demonstrated similar cardiovascular efficacy for dulaglutide and suggested benefit in patients both with and without prior cardiovascular disease.[4] These findings raise the broader question of whether cardiovascular benefits of modern incretin therapies extend to individuals without established atherosclerotic cardiovascular disease (ASCVD) when used in routine clinical practice.

To address this question, this comparative effectiveness study will use a target trial emulation approach to assess the incretin therapies dulaglutide, semaglutide, and tirzepatide vs sitagliptin (used as an active comparator placebo proxy) on major adverse cardiovascular events (MACE) among individuals with type 2 diabetes (T2DM) and overweight with or without ASCVD.

Although many features of the target trial cannot be directly replicated in healthcare claims, measurements of key design features, including outcomes, exposures, and inclusion/exclusion criteria, were designed to proxy those features from the target trial. Randomization cannot be achieved in healthcare claims data but was proxied through a statistical balancing of measured covariates according to standard practice.

The database analyses will be new-user active-comparative studies, conducted using 3 national United States claims databases, where we compare the effect of dulaglutide, semaglutide, and tirzepatide vs sitagliptin on preventing atherosclerotic cardiovascular events.

Optum: Eligible cohort entry period from September 18, 2014 to May 31, 2025.
Marketscan: Eligible cohort entry from September 18, 2014 to September 30, 2023.
Medicare: Eligible cohort entry from September 18, 2014 to September 30, 2020.

Version 2	June 5, 2026	Appendix Section 2c	The exclusion criterion for cancer was revised from excluding all patients with any cancer history to	This amendment brings the operational exclusion criterion closer to the eligibility criteria used in RCTs for incretin-based therapies, which apply targeted exclusion criteria rather than excluding all patients with any history for

			excluding only patients with markers of active, advanced, or clinically severe cancer near baseline.	cancer. The revised criterion improves clinical specificity and preserves generalizability to patients with localized, remote, or successfully treated cancers who may not have an active competing risk during follow-up.

4. Rationale and background

The purpose of this protocol is to specify two target trial emulation studies, one in patients with ASCVD, the other in patients without ASCVD, where ASCVD is defined in alignment with international guidelines on cardiovascular disease prevention and management of blood cholesterol.[5–7]. Each target trial emulation study will assess the comparative effectiveness of the three incretin-based agents dulaglutide, semaglutide, and tirzepatide vs the dipeptidyl peptidase-4 (DPP-4) inhibitor sitagliptin (used as an active comparator placebo proxy) on MACE in patients with type 2 diabetes and overweight. Clinical guidelines during the study period recommended both drug classes under investigation as second- or third-line options for glucose lowering and the compared drug classes were similarly costly.

The glucagon-like peptide-1 receptor agonists (GLP-1-RA) dulaglutide was approved on September 18, 2014 to improve glycemic control in adults with T2DM.[8] On February 21, 2020, FDA approved dulaglutide to reduce the risk of major adverse cardiovascular events in adults with T2DM who have established CVD or multiple cardiovascular risk factors.[9] In the same year, on March 9, an additional dosing regimen was approved.[10] Finally, on November 17, 2022, dulaglutide was approved for use in pediatric patients aged 10 years and older.

Injectable semaglutide became available on December 5, 2017 under the brand name Ozempic.[11] On January 16, 2020, the approval was expanded to include cardiovascular risk reduction in adults with type 2 diabetes mellitus and known heart disease. On March 28, 2022, Novo Nordisk received FDA approval for a higher-dose semaglutide (2 mg) to provide improved glycemic control for adults with type 2 diabetes mellitus. Meanwhile, semaglutide received its first FDA approval for the treatment of obesity in adults under the brand name Wegovy on June 4, 2021. On December 23, 2022, the approval was extended to include teenagers aged 12 and older. Later, on March 8, 2024, Wegovy was additionally approved for cardiovascular risk reduction in people with overweight or obesity and established cardiovascular disease. On January 28, 2025, Ozempic became the first and only GLP-1-RA approved to reduce the risk of worsening kidney disease and cardiovascular death in adults with Type 2 diabetes and chronic kidney disease.

The dual GLP-1 and glucose-dependent insulinotropic polypeptide (GIP)-RA tirzepatide became available on May 13, 2022, when it was approved to treat type 2 diabetes mellitus.[12] A year later, on November 8, 2023, tirzepatide was approved for chronic weight management in adults with obesity or overweight who also have at least one weight-related comorbid condition, such as hypertension, dyslipidemia, type 2 diabetes mellitus, obstructive sleep apnea, or cardiovascular disease. Later on, on December 20, 2024, tirzepatide was approved to treat moderate to severe obstructive sleep apnea (OSA) in adults with obesity, to be used in combination with a reduced-calorie diet and increased physical activity.

Sitagliptin was specifically chosen as an active comparator that could proxy for placebo because a major randomized controlled trial on cardiovascular outcomes demonstrated that it does not affect the cardiovascular outcomes under investigation.[13] This contrasts with other DPP4i such as saxagliptin,

which has raised concerns regarding potential increased risks of heart failure, [14–17] and linagliptin, which is commonly prescribed for patients with renal impairment because it does not require dose modifications based on kidney function, potentially leading to increased confounding compared to sitagliptin.[18,19] Sodium-glucose Cotransporter-2 (SGLT2) inhibitors would not be a neutral comparator, as they significantly reduce clinically important kidney events, kidney failure, and cardiovascular events.[20–23] Sulfonylureas (SUs), though inexpensive and widely used, are a poor comparator in cardiovascular outcome studies due to their association with hypoglycemia, weight gain, and channeling bias, as they are often prescribed to elderly, lower socioeconomic status patients with higher baseline cardiovascular risk, making direct comparisons to other GLP-1-RAs less reliable.[24]

Previous emulation studies have been benchmarked against reference RCTs evaluating clinically related questions on the cardiovascular benefits of semaglutide and tirzepatide, and have obtained results that closely replicated findings of the trials. These benchmarking studies have increased our understanding and confidence in the robustness of the design, data, and analytic approach. We will draw from this infrastructure, tailored to address the study question outlined in this protocol. In alignment with our previous work and pivotal cardiovascular outcomes trials such as REWIND, SUSTAIN-6, and SURPASS-CVOT, we consider the event of MACE (myocardial infarction or stroke) with and without all-cause mortality as a co-primary end point. All-cause mortality will be interpreted with caution as an end point in this study, as a previous emulation of the SUSTAIN-6 cardiovascular outcomes trial showed divergent results for mortality that were suggestive of residual confounding, informing the development of the current protocol.

Table 2. Primary and secondary research questions and objectives

A. Co-Primary research questions and objectives: Individuals with ASCVD

Objective:	To evaluate the comparative effect of dulaglutide, semaglutide, and tirzepatide vs sitagliptin on the composite of myocardial infarction, stroke, or all-cause mortality in individuals with T2DM and overweight with ASCVD.
Hypothesis:	We hypothesize that dulaglutide, semaglutide, and tirzepatide will be superior to sitagliptin at preventing myocardial infarction, stroke, or all-cause mortality in individuals with T2DM and overweight with ASCVD.
Population (mention key inclusion-exclusion criteria):	Individuals with T2DM and overweight with ASCVD.
Exposure:	Dulaglutide, injectable semaglutide, tirzepatide.
Comparator:	Sitagliptin.
Outcome:	Composite of myocardial infarction, stroke, or all-cause mortality.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, 365 days after cohort entry, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA or DPP4i.

Setting:	The outcome will be measured from inpatient hospitalizations and death index.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of dulaglutide, semaglutide, and tirzepatide vs sitagliptin on the composite of myocardial infarction or stroke in individuals with T2DM and overweight with ASCVD.

Outcome:	Composite of myocardial infarction, stroke, hospitalization for unstable angina, coronary revascularization, or hospitalization for heart failure.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, 365 days after cohort entry, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA or DPP4i.
Setting:	The outcome will be measured from inpatient hospitalizations.

Objective:	To evaluate the comparative effect of dulaglutide, semaglutide, and tirzepatide vs sitagliptin on the occurrence of unstable angina in individuals with T2DM and overweight without ASCVD.
Hypothesis:	We hypothesize that dulaglutide, semaglutide, and tirzepatide will be superior to sitagliptin at preventing the occurrence of unstable angina events in individuals with T2DM and overweight without ASCVD.
Population (mention key inclusion-exclusion criteria):	Individuals with T2DM and overweight without ASCVD.
Exposure:	Dulaglutide, injectable semaglutide, tirzepatide.
Comparator:	Sitagliptin.
Outcome:	Unstable angina.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, 365 days after cohort entry, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA or DPP4i.
Setting:	The outcome will be measured from inpatient hospitalizations.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of dulaglutide, semaglutide, and tirzepatide vs sitagliptin on the occurrence of coronary revascularization in individuals with T2DM and overweight without ASCVD.
Hypothesis:	We hypothesize that dulaglutide, semaglutide, and tirzepatide will be superior to sitagliptin at preventing the occurrence of coronary revascularization in individuals with T2DM and overweight without ASCVD.
Population (mention key inclusion-exclusion criteria):	Individuals with T2DM and overweight without ASCVD.
Exposure:	Dulaglutide, injectable semaglutide, tirzepatide.
Comparator:	Sitagliptin.
Outcome:	Coronary revascularization.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, 365 days after cohort entry, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA or DPP4i.
Setting:	The outcome will be measured from inpatient hospitalizations.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of dulaglutide, semaglutide, and tirzepatide vs sitagliptin on the occurrence of hospitalization for heart failure in individuals with T2DM and overweight without ASCVD.
Hypothesis:	We hypothesize that dulaglutide, semaglutide, and tirzepatide will be superior to sitagliptin at preventing the occurrence of hospitalization for heart failure events in individuals with T2DM and overweight without ASCVD.
Population (mention key inclusion-exclusion criteria):	Individuals with T2DM and overweight without ASCVD.
Exposure:	Dulaglutide, injectable semaglutide, tirzepatide.
Comparator:	Sitagliptin.
Outcome:	Hospitalization for heart failure.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, 365 days after cohort entry, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA or DPP4i.
Setting:	The outcome will be measured from inpatient hospitalizations.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of dulaglutide, semaglutide, and tirzepatide vs sitagliptin on time to first hospitalization for any cause in individuals with T2DM and overweight without ASCVD.
Hypothesis:	We hypothesize that dulaglutide, semaglutide, and tirzepatide will be superior to sitagliptin at preventing all-cause hospitalizations in individuals with T2DM and overweight without ASCVD.
Population (mention key inclusion-exclusion criteria):	Individuals with T2DM and overweight without ASCVD.
Exposure:	Dulaglutide, injectable semaglutide, tirzepatide.
Comparator:	Sitagliptin.
Outcome:	Time to first hospitalization for any cause.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, 365 days after cohort entry, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA or DPP4i.
Setting:	The outcome will be measured from inpatient hospitalizations.
Main measure of effect:	Hazard ratio.

E. Safety research questions and objectives: Individuals with ASCVD

Objective:	To evaluate the comparative effect of dulaglutide, semaglutide, and tirzepatide vs sitagliptin on the safety outcome of urinary tract infections in individuals with T2DM and overweight with ASCVD.
Hypothesis:	We hypothesize that dulaglutide, semaglutide, and tirzepatide will not have a different effect from sitagliptin.
Population (mention key inclusion-exclusion criteria):	Individuals with T2DM and overweight with ASCVD.
Exposure:	Dulaglutide, injectable semaglutide, tirzepatide.
Comparator:	Sitagliptin.
Outcome:	Urinary tract infections.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, 365 days after cohort entry, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA or DPP4i.
Setting:	The outcome will be measured using diagnosis codes in an inpatient or outpatient setting that are followed by an antibiotic prescription within 7 days of the diagnosis code.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of dulaglutide, semaglutide, and tirzepatide vs sitagliptin on the safety outcome of serious infections in individuals with T2DM and overweight with ASCVD.
Hypothesis:	We hypothesize that dulaglutide, semaglutide, and tirzepatide will not have a different effect from sitagliptin.
Population (mention key inclusion-exclusion criteria):	Individuals with T2DM and overweight with ASCVD.
Exposure:	Dulaglutide, injectable semaglutide, tirzepatide.
Comparator:	Sitagliptin.
Outcome:	Serious infections.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, 365 days after cohort entry, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA or DPP4i.
Setting:	The outcome will be measured using primary diagnosis codes in an inpatient setting.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of dulaglutide, semaglutide, and tirzepatide vs sitagliptin on the safety outcome of gastrointestinal adverse events in individuals with T2DM and overweight with ASCVD.
Hypothesis:	We hypothesize that dulaglutide, semaglutide, and tirzepatide will not have a different effect compared to sitagliptin.
Population (mention key inclusion-exclusion criteria):	Individuals with T2DM and overweight with ASCVD.
Exposure:	Dulaglutide, injectable semaglutide, tirzepatide.
Comparator:	Sitagliptin.
Outcome:	Gastrointestinal adverse events.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, 365 days after cohort entry, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA or DPP4i.
Setting:	The outcome will be measured using diagnosis codes in an inpatient and outpatient setting.
Main measure of effect:	Hazard ratio.

F. Safety research questions and objectives: Individuals without ASCVD

Objective:	To evaluate the comparative effect of dulaglutide, semaglutide, and tirzepatide vs sitagliptin on the safety outcome of urinary tract infections in individuals with T2DM and overweight without ASCVD.
Hypothesis:	We hypothesize that dulaglutide, semaglutide, and tirzepatide will not have a different effect from sitagliptin.
Population (mention key inclusion-exclusion criteria):	Individuals with T2DM and overweight without ASCVD.
Exposure:	Dulaglutide, injectable semaglutide, tirzepatide.
Comparator:	Sitagliptin.
Outcome:	Urinary tract infections.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, 365 days after cohort entry, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA or DPP4i.

Setting:	The outcome will be measured using diagnosis codes in an inpatient and outpatient setting.
Main measure of effect:	Hazard ratio.

G. Additional research questions and objectives: Individuals with ASCVD

Objective:	To evaluate the effect of dulaglutide, semaglutide, and tirzepatide vs sitagliptin on negative control outcomes, (1) hernia and (2) lumbar radiculopathy in individuals with T2DM and overweight with ASCVD.
Hypothesis:	We hypothesize that dulaglutide, semaglutide, and tirzepatide will not have a different effect compared to sitagliptin.
Population (mention key inclusion-exclusion criteria):	Individuals with T2DM and overweight with ASCVD. In addition, patients will be excluded with recent hernia or lumbar radiculopathy prior to the follow-up time window (30 days) when studying the negative outcome hernia or lumbar radiculopathy, respectively.
Exposure:	Dulaglutide, injectable semaglutide, tirzepatide.
Comparator:	Sitagliptin.
Outcome:	Separate analyses for hernia and lumbar radiculopathy.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, 365 days after cohort entry, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA or DPP4i.
Setting:	The outcome will be measured using diagnosis codes in an inpatient or outpatient setting.
Main measure of effect:	Hazard ratio.

H. Additional research questions and objectives: Individuals without ASCVD

Setting:	The outcome will be measured using diagnosis codes in an inpatient or outpatient setting.
Main measure of effect:	Hazard ratio.

6. Research methods

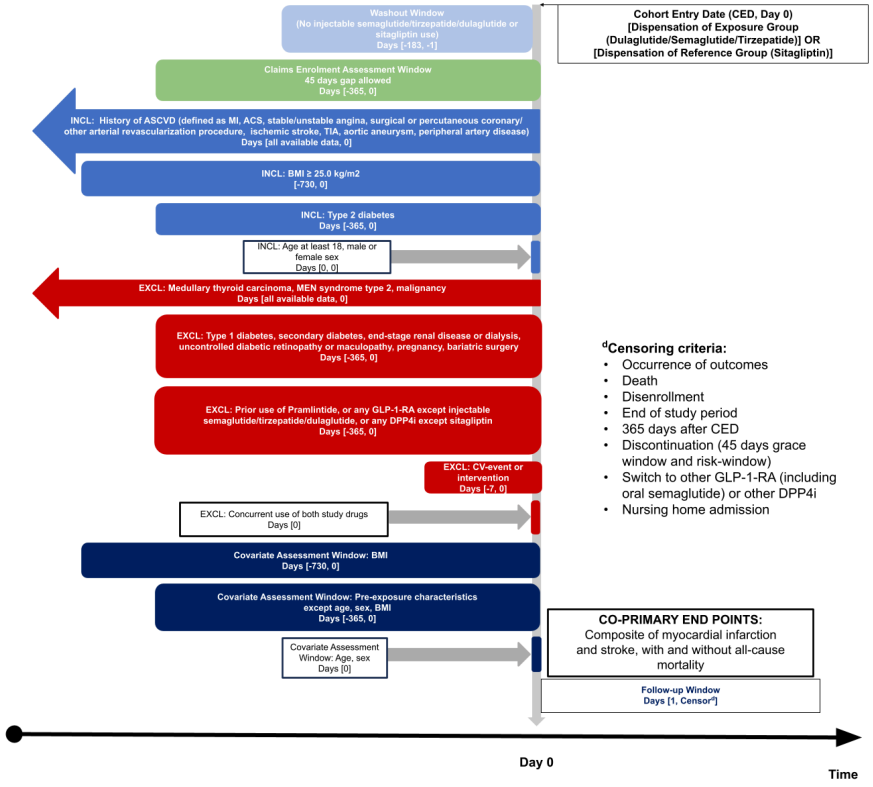
6.1 Study design

Research design (e.g. cohort, case-control, etc.): New user active-comparator cohort study.

Rationale for study design choice: The new user active-comparator design is a powerful design that may be able to address confounding by indication. It accomplishes this, in large part, through judicious selection of an appropriate active-comparator group.[25,26] While selection of an appropriate comparator in the design phase is crucial, cohort studies often require additional adjustment of measurable confounders. A common method for adjusting for confounding is via a propensity score.

6.2 Study design diagrams for the comparison of dulaglutide, semaglutide, or tirzepatide vs. sitagliptin, in two cohorts with or without ASCVD.

Figure 1. Study diagram for the comparison of dulaglutide/semaglutide/tirzepatide vs sitagliptin (with ASCVD).



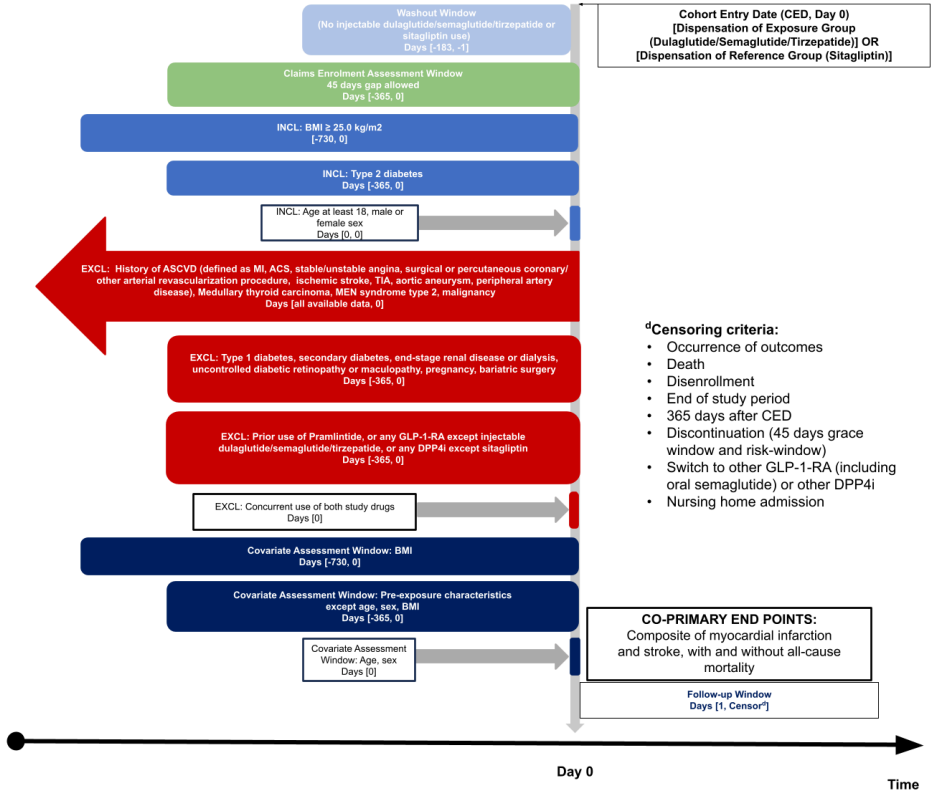


Figure 2. Study diagram for the comparison of dulaglutide/semaglutide/tirzepatide vs sitagliptin (without ASCVD).

6.3 Setting

6.3.1 Context and rationale for definition of time 0 (and other primary time anchors) for entry to the study population

Time 0 in the database studies was defined to emulate randomization to dulaglutide/ semaglutide/ tirzepatide vs sitagliptin in the trial design. See appendix tables 1[with_ASCVD, w/o_ASCVD] and 2a[with_ASCVD, w/o_ASCVD] for operational definitions and detailed code algorithms.

6.3.2 Context and rationale for study inclusion criteria:

Study inclusion criteria were defined to reflect clinical routine care settings in patients with and without ASCVD. See appendix tables 1[with_ASCVD, w/o_ASCVD] and 2[with_ASCVD, w/o_ASCVD] for operational definitions and detailed code algorithms. A flowchart of the study cohort assembly is provided in appendices 3[with_ASCVD, w/o_ASCVD].

6.3.3 Context and rationale for study exclusion criteria

Study exclusion criteria were defined to reflect clinical routine care settings in patients with and without ASCVD. See appendix tables 1[with_ASCVD, w/o_ASCVD] and 2[with_ASCVD, w/o_ASCVD] for operational definitions and detailed code algorithms. A flowchart of the study cohort assembly is provided in appendices 3[with_ASCVD, w/o_ASCVD].

6.4 Variables

6.4.1 Context and rationale for exposure(s) of interest

The exposure and comparator were defined to emulate the agents compared for the target trial, dulaglutide, semaglutide, or tirzepatide vs sitagliptin (active-comparator placebo proxy). See appendix tables 1[with_ASCVD, w/o_ASCVD] and 2[with_ASCVD, w/o_ASCVD] for operational definitions and detailed code algorithms.

Algorithm to define duration of exposure effect:

Assuming the effect of the drug lasts for 45 days after the last day's supply, we allow a 45 days gap between the dispensation (grace period) and also add 45 days at the end of the last day's supply (exposure risk window).

6.4.2 Context and rationale for outcome(s) of interest

The co-primary outcome for the database study was defined as MACE with and MACE without all-cause mortality in line with typical cardiovascular outcomes trials. The results for all-cause mortality or composite outcomes that include death will be interpreted with caution because a benchmarking database study designed to emulate the SUSTAIN-6 trial using Optum and MarketScan data yielded divergent results for the mortality outcome. See appendix tables 1[with_ASCVD, w/o_ASCVD] and 2[with_ASCVD, w/o_ASCVD] for operational definitions and detailed code algorithms. Optum includes death information from the inpatient discharged dead status, social security death master file, and deaths scraped from obituaries or other sources. MarketScan includes information from the inpatient discharged dead status as well as social security death master file. PPV for myocardial infarction using ICD9 codes was

94%. [27–29] PPV for ischemic stroke using ICD9 codes was 95%. Both of the above ICD9 codes were mapped to ICD10, but no validation study was performed.[30]

Secondary outcomes from the trial that will be evaluated include:

1. Myocardial infarction.
2. Stroke.
3. Composite of myocardial infarction, stroke, hospitalization for unstable angina, or coronary revascularization.
4. Composite of myocardial infarction, stroke, hospitalization for unstable angina, coronary revascularization, or hospitalization for heart failure.
5. Hospitalization for unstable angina.
6. Coronary revascularization.
7. Hospitalization for heart failure.
8. Time to first hospitalization for any cause.

Safety outcomes of interest include:

1. Urinary tract infections.
2. Serious infections.
3. Gastrointestinal adverse events.

Control outcomes of interest include:

1. Hernia (excluding patients with recent outcome prior to the follow-up time window). This is a negative control outcome where no difference in effect is expected for any of the prespecified active-comparator comparisons.
2. Lumbar radiculopathy (excluding patients with recent outcome prior to the follow-up time window). This is a negative control outcome where no difference in effect is expected for for any of the prespecified active-comparator comparisons.

6.4.3 Context and rationale for follow-up

Both on-treatment (OT) and intention-to-treat (ITT) analyses will be conducted. Adherence in clinical practice databases is expected to be much worse than in a trial, therefore the OT analysis will be the primary analysis. The OT analysis targets the relative hazard of outcomes while on treatment and may more closely emulate the effect observed in highly adherent trial participants. Both OT and ITT analyses will be conducted with up to 1-year follow-up.

Table 1. Operational Definitions of follow-up

follow-up start	Day 1	
follow-up end[1]	**Select all that apply**	**Specify**
Date of outcome	Yes	
Date of death	Yes	Part of the primary outcome.
End of observation in data	Yes	Date of disenrollment.
Day X following index date (specify day)	Yes	Day 365.
End of study period (specify date)	Yes	Different dates for different databases (Optum: August 31, 2025; MarketScan: October 31, 2023; Medicare: October 31, 2020).
End of exposure (specify operational details, e.g. stockpiling algorithm, grace period)	Yes	45 days grace window and 45 days risk window.
Date of add to/switch from exposure (specify algorithm)	Yes	Date of augmentation or switching from an exposure to a comparator and vice versa.
Other date (specify)	Yes	Censor upon nursing home admission or starting any other GLP-1-RA (including oral semaglutide) or DPP4i.

[1] follow-up ends at the first occurrence of any of the selected criteria that end follow-up.

6.4.4 Context and rationale for covariates (confounding variables and effect modifiers, e.g. risk factors, comorbidities, comedications)

We identified a series of covariates that were likely confounders due to being strong risk factors for the outcomes of interest that were associated with choice of treatment. These include demographics, disease severity related variables, comorbid conditions, comedications, frailty, healthcare utilization and markers of health seeking behaviour.

6.5 Data analysis

6.5.1 Context and rationale for analysis plan

The studies will use a propensity score based overlap weighting method.[34] This approach was selected because it covariate balance while preserving patients, thereby maximizing power. The propensity score will be estimated as the probability of initiating dulaglutide, injectable semaglutide, or tirzepatide vs sitagliptin given the baseline patient characteristics using multivariable logistic regression models. As diagnostics for PS models, the study will evaluate distributional overlap, weight distribution, and covariate balance using standardized differences post-weighting. The study will estimate the hazard ratio for injectable semaglutide, tirzepatide, or dulaglutide vs sitagliptin on MACE outcome in the weighted population using a Cox proportional hazards mode with robust standard errors. Effect estimates obtained across databases will be summarized using fixed-effects models for meta-analysis.

Table 3. Primary, secondary, and subgroup analysis specification

A. Co-primary analysis: Individuals with ASCVD

Hypothesis:	Dulaglutide, semaglutide, and tirzepatide vs sitagliptin decreases the risk of a composite event of myocardial infarction, stroke, or death in individuals with T2DM and overweight with ASCVD.
Exposure contrast:	Dulaglutide, injectable semaglutide, and tirzepatide vs sitagliptin.
Outcome:	Composite of myocardial infarction, stroke, or all-cause mortality.
Analytic software:	Aetion, SAS 9.4, R.4.4.0, Python 3.13.3

Table 4. Sensitivity analyses – rationale, strengths and limitations

	What is being varied? How?	Why? (What do you expect to learn?)	Strengths of the sensitivity analysis compared to the primary	Limitations of the sensitivity analysis compared to the primary
Negative control outcomes, including hernia and lumbar radiculopathy	We evaluate negative control outcomes of hernia and lumbar radiculopathy, where no causal effect is expected from tirzepatide, dulaglutide, semaglutide, or sitagliptin.	We will evaluate the potential impact of residual confounding on this outcome for which there is not expected to be a causal effect	Evaluates the robustness of the interpretation of the primary analysis by evaluating the potential magnitude of unmeasured confounding	This analysis assumes that the confounding structure is the same or similar for the negative control outcome as the outcome of interest
Effect estimation in individuals with HbA1c measurement.	The population will be restricted to individuals with a HbA1c measurement in the 120 days before cohort entry.	To assess the impact of restricting to individuals with HbA1c measurement and including HbA1c in the PS model.	Includes baseline glycemic information as captured in laboratory HbA1c measurements.	This approach highly restricts the number of eligible individuals under study and thereby the statistical power of the analysis.
As-started analyses (observational analogue to intention-to-treat) to address potential informative censoring.	To address potential informative censoring.	We will consider the first-used medication for 365 days without considering drug discontinuation or switching, mimicking an “intention-to-treat” approach.	Reflects follow-up regimen of RCT.	Persistence of drug use is shorter in clinical practice whereas adherence is typically higher in RCTs. Therefore, we expect the estimated effects will be diluted toward the null, underestimating the true treatment effect had patients remained on therapy.
2-year on-treatment analysis	We will follow the patients for up to 2 years on-treatment.	To examine potential changes in the comparative effectiveness beyond the 1-year on-treatment analysis.	Examines potential changes of effectiveness beyond the 1-year follow-up in the primary analysis.	Few patients in clinical practice remain on treatment beyond one year. Consequently, the small number of individuals still at risk during extended follow-up represents a selected subset of patients, which may introduce bias. Moreover, the sparse data in this later period mean that outcomes among a few remaining participants can

				have a disproportionate effect on the Kaplan–Meier estimates.
ASCVD misclassification assessment including (1) varying lookback windows for ASCVD ascertainment, and (2) quantitative bias analysis	(1): Within a fixed subset of the primary cohort with ≥24 months of continuous pre-index enrollment, we vary the ASCVD ascertainment window (e.g., 6, 12, 18, and 24 months, all available data). We will report the number of patients from the primary cohort meeting the fixed enrollment requirement and assess the proportion of patients reclassified from no-ASCVD to ASCVD as the window extends. (2): We then recalculate effect estimates under assumptions of (a) non-differential misclassification (equal misclassification across exposure groups and outcome strata) and (b) differential misclassification, allowing misclassification parameters to vary by exposure status and by outcome status.	To quantify misclassification or what proportion of patients in the "without-ASCVD" group actually had prior events that are missed as the window shortens. We aim to model the extent to which the "no-ASCVD" cohort is contaminated by individuals who actually have a history of ASCVD (found in step 1). We will then adjust the observed HRs to account for the mixing of effects (step 2).	Quantifies the trade-off between data retention and strict disease-free classification. Helps identify the optimal window where extending the required available lookback yields diminishing returns on exclusions. Evaluates the robustness of our findings by providing a range of bias-adjusted effect estimates under different assumptions.	While informed by the lookback window assessment, the true proportion of misclassification of ASCVD status in the “no-ASCVD” group remains unknown. The quantitative bias analysis relies on assumptions on non-differential and differential misclassification. In the differential misclassification scenario, we vary the degree of imbalance between exposure status, as well as the magnitude of the ASCVD-outcome association.

6.6 Data sources

6.6.1 Context and rationale for data sources

Reason for selection: The studies will be conducted in 3 US health care claims databases: Optum Clinformatics (2004-2025), Merative MarketScan (2012-2023), and Medicare (2007-2020).

Strengths of data source(s): Each data source contains deidentified, longitudinal, date-stamped information on patient enrollment, demographics, inpatient/outpatient diagnosis and procedures, admission and discharge dates, and medication dispensation. The death data is captured in the Optum database from inpatient discharge status, social security death master file, and deaths scraped from obituaries or other sources. The death data in MarketScan is captured from the social security death master file and inpatient discharge status. It is recognized that the social security death master file has high specificity and positive predictive value for deaths. While this data resource has under captured deaths since 2011, the capture of deaths is not expected to be differential between compared exposure groups. The death data is captured in the Medicare database from inpatient discharge status, and social security death master file.[35–37]

Limitations of data source(s): Patient healthcare encounters are only observable when they are enrolled in an insurance plan that contributes to the database. Patients may change insurance plans for multiple reasons. Both Optum Clinformatics and Merative MarketScan are primarily employer based insurance databases where patients may disenroll with job changes. In claims data, dispensing data for inpatient medication is unavailable. Diagnoses reflect billing practices, therefore algorithms (preferably validated) are needed for accurate phenotyping of patient conditions. Services that are not covered by insurance do not appear in the data. The trial evaluated cardiovascular deaths, however we will evaluate all-cause mortality in the emulation because most deaths in this cohort of patients at high cardiovascular risk will likely be attributed to cardiovascular reasons, the cause of death is not recorded for databases not linked to NDI, and the performance of NDI at identifying cardiovascular causes of death may be suboptimal. [37] The completeness of death ascertainment differs across the three databases. Optum captures deaths from multiple sources, including inpatient discharge status, the Social Security Death Master File, and obituary-based sources, whereas Medicare includes death information from inpatient discharge records, the Social Security Death Master File, and National Death Index linkages. In contrast, death ascertainment in MarketScan is more limited and is primarily based on inpatient discharge status, resulting in undercapture of deaths occurring outside the hospital setting. Although this limitation may reduce the sensitivity of mortality ascertainment, it is not expected to differ systematically between treatment groups and therefore is unlikely to introduce substantial differential bias in comparative effect estimates.

Data source provenance/curation:

Information about Optum Clinformatics and Merative MarketScan can be found in data dictionaries and user guides that are provided to clients.

6.7 Data management

Tracking data: The Data Use Agreement (DUA) Custodian (Principal Investigator) and the Division Operations Manager (Winta Tekle) are responsible for receiving and creating a record of new data associated with the given request. The Operations Manager is responsible for all indexing and archiving of documents and electronic media related to data that the Division receives and will log data location, data contents, and associated DUA and Institutional Review Board (IRB) numbers in the Division's centralized tracking system.

Handling and storage: In-scope data will be stored utilizing Mass General Brigham approved information systems – i.e., Division servers and Mass General Brigham network storage.

Archiving: Data retention and any removal will be executed by the Division Operations Manager (Winta Tekle) and Data Manager (Todd MacGarvey). The Division follows Mass General Brigham enterprise record retention policies and follows the terms of the agreement through which the in-scope data was received.

Information security: The Division follows Mass General Brigham's Enterprise Information Security Program (EISP). The EISP helps by providing assurance that Mass General Brigham information and information systems are protected from unauthorized access, use, disclosure, duplication, modification, or destruction in order to maintain their confidentiality, integrity, and availability. To that end, the EISP policies, standards and procedures create an information security framework that is aligned with the recommendations of the International Organization for Standardization's (ISO) publication 27001 and the National Institute of Standards and Technology's (NIST) publication 800-53 Family of Controls and MGB regulatory and legal requirements (as a HIPAA covered entity).

Mass General Brigham workforce members are required to complete new workforce privacy and information security training upon hire and annually thereafter. Refresh training is provided as appropriate. Mass General Brigham workforce members are required to review and sign a Confidentiality Agreement upon hire and annually thereafter. Additionally, we follow Enterprise Information Security and Privacy policies, including Managing Workforce Members Information Security Responsibilities Policy, which was developed to help assure that Mass General Brigham workforce members are competent and eligible to support the information security responsibilities associated with their role. Mass General Brigham workforce, including Division staff, are required to comply with Enterprise Information Security and Privacy Policies.

Facilities: The research team uses a highly secure, state-of-the-art, computing facility housed at Mass General Brigham's Corporate Data Centers in Needham and Marlborough, Massachusetts as well as Amazon Web Services (AWS). We maintain redundant storage for maximal data integrity and high-speed data access.

The Division uses Mass General Brigham corporate provisioned servers to analyze and store data in connection with this project. There are strict access controls enforced by technical means to ensure that only study staff who have been approved to conduct data analyses and contracted data engineers are able to access data (e.g., Mass General Brigham Authentication (Active Directory) utilized; auditing, logging, and monitoring enabled; firewalls enabled; etc.). All Division servers used in this study are accessible to only authorized staff only through the MGB network and utilizing VPN as appropriate (i.e., users must be on the network and logged into VPN to access). Mass General Brigham has a network information security monitoring team and in-scope servers are enrolled in enterprise security tools (e.g., vulnerability scanning service, antivirus, etc.).

The Division also uses AWS. In-scope AWS services / resources have undergone review and assessment by Mass General Brigham's Information Security Risk Assessment Team/ InfoSec Risk Management Team as required and in alignment with NIST 800-30: Guide for Conducting Risk Assessments. In-scope AWS servers are for our exclusive use (reserved instances), and are covered under our organization's Business Associate Agreement with AWS. In-scope servers are housed in anonymous facilities that are not branded as AWS facilities. Physical access is strictly controlled both at the perimeter and at building ingress points by professional security staff utilizing video surveillance, intrusion detection systems, and other electronic means.

Security attributes and controls for the Division's use of in-scope AWS in connection with this project include: encryption at rest and in transit (industry standard AES-256 encryption, SSL/TSL), anti-malware, latest OS updates and patches as well as anti-virus; multi-factor authentication (MFA), Identity and Access Management, including SSO; auditing and logging; principle of least privilege, including for traffic and ports (e.g., deny all default configurations), use of VPC enabled Step functions, etc.; separation between environments; minimum necessary (out of the box AWS roles are not used as they can be overly permissive); all data would reside in the US domestic regions – use only US east HIPAA compliant region; performance monitoring enabled and reviewed as per internal processes; passwords compliant with enterprise password policy and, as appropriate, more protective password

requirements; etc. Our Division's AWS use is also subject to ongoing evaluation and monitoring as well – e.g., vulnerability scanning and management, access review, etc.

A data file list will be maintained in Amazon S3 and tracked through Cloudtrail and Cloudwatch. Reporting of data file availability for any file stored in an S3 bucket will be controlled by MGB.

Amazon EC2, Amazon EBS, and Amazon VPC are integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in Amazon EC2, Amazon EBS, and Amazon VPC. CloudTrail captures all API calls for Amazon EC2, Amazon EBS, and Amazon VPC as events, including calls from the console and from code calls to the APIs. MGB IT/security staff have full access to CloudTrail to ensure that CloudTrail monitoring is available at all times. Amazon CloudWatch Events delivers a near-real-time stream of system events that describe changes in AWS resources. Amazon CloudTrail can log, continuously monitor, and retain account activity related to actions across the MGB AWS infrastructure. CloudTrail provides event history of MGB AWS account activity. This event history simplifies security analysis, resource change tracking, and troubleshooting and complies with requirements to ensure the data file inventory is controlled by MGB.

Backups: Backups are created using industry recognized Cryptographic mechanisms (e.g., 256-bit AES encryption) as appropriate and required. Data are backed up within the MGB network from the MGB Needham data center to the MGB Marlborough data center via replication/mirroring and volume-level snapshots. AWS Backup supports both instance-level backups as Amazon Machine Images (AMIs) and volume-level backups as separate snapshots based on the resource tags. AMIs allow MGB IT and security staff to create backups of all S3 and EC2 instances.

In addition to the safeguards listed above, the Division follows enterprise privacy and information security policies and maintains internally procedures in connection with this project to safeguard the data in connection with this project as appropriate and required including: Physical Security and Environmental Controls for Electronic Information Policy; IT Access Control Standards for Users policy; Safeguarding Fax Copiers Printers Telephone Use and Pagers; Physical Removal and Transport of Protected Health Information and Personal Information policy, etc.

6.8 Quality control

Senior Programmers and Research Specialists perform QA/QC on raw or common data model converted data via SAS/R/Aetion software. The protocol will be iteratively developed and pre-specified data checks including feasibility counts and balance on baseline covariates will be conducted with outputs reviewed by MGB team members. Team members will review code lists to ensure fidelity to intended algorithms.

6.9 Study size and feasibility

See appendices $4^{with\_ASCVD,\ w/o\_ASCVD}$ and appendices $5^{with\_ASCVD,\ w/o\_ASCVD}$ (feasibility, weighting on age, sex, comorbidity score as well as all predefined propensity score variables). Propensity score distribution plots with c-statistics are available in appendices $6^{with\_ASCVD,\ w/o\_ASCVD}$. Tables $1^{with\_ASCVD,\ w/o\_ASCVD}$ showing prevalence of baseline characteristics and standardized differences in distribution are available in appendices $7^{with\_ASCVD,\ w/o\_ASCVD}$. Additional diagnostic evaluations, including balance assessments of laboratory and clinical examination test results not included in the propensity score will be conducted to assess potential residual confounding and divergence of treatment over time.

7. Limitation of the methods

As we are using secondary data and the data were not collected for research purposes, some important variables may not be collected or will be measured imperfectly. We have selected validated algorithms when possible and we have created proxies for important variables that are not directly captured in the data to reduce confounding by unmeasured factors.

8. Protection of human subjects

This study has been approved by the Brigham and Women's Hospital Institutional Review Board.
