## Revision History

### Version 1.0 to 1.1

- Add Tables 4-6
  - Add additional analysis of number and proportion of subjects who experience SSI or mortality within 30 days by treatment group
- Add Tables 16-18, 25-27
  - Add additional analysis of total ASEPSIS score by treatment group
- Figure 5
  - Add additional PK analysis figure for median doxycycline concentration levels
- Selected tables were modified to remove analysis by visit

## 1.0 Synopsis of Study Design Procedures

This study is a prospective, multicenter, randomized, controlled, two arm, single blind, study to assess safety and efficacy of D-PLEX administered concomitantly with the standard of care (SOC) in prevention of post abdominal surgery incisional infection, compared to SOC treated control arm. The objectives of this Phase II study are as follows:

- To assess the anti-infective efficacy of D-PLEX (in addition to SOC) over a period of 30 days post operation, by preventing surgical site infection (SSI) defined as superficial and deep abdominal wall surgical incision infection, compared to the SOC treated control arm.
- To assess the safety of D-PLEX.

### 1.1 Design and Treatment

Subjects will be randomized on day 0 to either the investigational arm (SOC + D-PLEX) or to the control arm (SOC only) at a 1:1 ratio. Randomization will be balanced by gender, age (18-40, 41-65, 66 and above), type of surgery (open laparotomy or laparoscopic), and inclusion of colostomy (yes/no). Investigational product (IP) will be administered under single-blind conditions such that the subject does not know if they are receiving D-PLEX + SOC or just the SOC.

SOC + D-PLEX (amount based on size of incision) or SOC alone will be applied during the abdominal surgery at the stage of closure of the abdominal wall surgical target incision. The total dose applied at the surgical site will be determined based on surgical incision length with a maximum of three vials (15g) being administered. Dosage will be administered as follows:

Surgical Incision Length (cm)	Number of Vials to Apply
5-10	1
11-20	2
≥21	3

### 1.2 Study Procedures

The study includes procedures at screening (within 21 days of surgery), pre-application of D-PLEX (Day 0), procedure (Day 0), and post-application (Day 1, 5, 14, 30, and 60).

#### Visit 1: Screening Period (Day -21 to Day 0)

Patient will be screened for study eligibility at the clinic within 21 days prior to surgery (Day -21 to 0). The following screening assessments will be performed:

- Sign an Informed Consent form before any of the study related procedures are performed
- Assign (from the eCRF) a sequentially ordered patient number for the site. If a patient is withdrawn from the study or fails to undergo the treatment procedure, the patient number cannot be reassigned
- Record demographics (including age, gender, etc.)
- Record medical history
- Complete allergy questionnaire
- Record concomitant medications
- Measure vital signs (height, weight, temp., heart rate & blood pressure)
- Perform physical examination
- Perform blood laboratory tests\*
- Perform 12-lead ECG\*\*
- Perform Urinalysis\*
- Perform a rectal swab for bacteriology
- Record baseline safety (any future planned elective procedure should be recorded so it will not be counted later on as an adverse event (AE) or serious adverse event (SAE) as applicable)
- Eligibility determination according to inclusion and exclusion criteria
  - \* Blood tests and Urinalysis done at the medical center's lab within 21 days prior to surgery may be used for eligibility determination.
  - \*\* ECG done within the last 90 days prior to surgery can be used for eligibility determination.

**Visit 2: Surgery – Index Procedure (Day 0)**

- Randomization\*\*\* (randomization is patient specific, if a patient is withdrawn from the study or fails to undergo the treatment procedure, the randomization number cannot be reassigned)
- Vital signs
- Pre-application Doxycycline PK sampling (for applicable subjects)
- Abdominal Surgery
- D-PLEX administration at the stage of closure of the abdominal wall surgical incision
- Post-application Doxycycline PK sampling (at 2h, 4h, 6h, 8h & 12h)
- AEs assessment and recording
- Concomitant Medication Review

\*\*\* For surgery planned for early morning time, randomization via the eCRF could be done a day in advance.

**Visits 3 – 6: Follow up Visits (Days 1, 5, 14 & 30 post-surgery)**

Post-operative care will be performed per SOC. Post-operative resumption of activity are at the discretion of investigator based on subject medical condition.

The subsequent follow up visits will take place at Day 1, Day 5 and Day 14 post-surgery. These visits are usually performed after this type of surgery.

The additional follow up visit will take place at Day 30 post-surgery and is required by the study, i.e. in addition to the routine visits usually performed after this kind of surgery.

During all the above-mentioned visits, the following procedures will be performed:

- Vital signs
- Assessment of surgical site wound healing – Including visual examination and wound assessment questionnaire
- Laboratory examinations
- Post-application Doxycycline PK sampling
- AE assessment and recording
- Concomitant Medication Review
- Physical examination [at Day 30]
- Perform a rectal swab for comparable bacteriology [at Day 30]

Urinalysis will be performed only at the discretion of the Investigator.

Bacteriology cultures will be taken if there is wound discharge.

**Visit 7: End of Study (Day 60 post-surgery)**

- Vital signs
- Assessment of surgical site
- Laboratory examinations
- Adverse Events assessment and recording
- Concomitant Medication Review
- Physical examination

**1.3 Sample Size**

The study will enroll a total of [REDACTED] subjects, with [REDACTED] subjects allocated to each treatment group. The sample size was chosen by the Sponsor to collect adequate data for evaluating the primary study objectives. This study is not powered to test formal statistical hypotheses; however, exploratory sample size calculations show that a sample of [REDACTED] subjects provides 80% power to detect an 80% decrease in the SSI rate (15% versus 3%) at a two-sided  $\alpha=0.10$  level of significance.

A blinded non-comparative sample size reassessment to evaluate infection rate will be conducted after a total of [REDACTED] and [REDACTED] have been assessed for primary efficacy endpoint. The maximal sample size allowed to upsize is about [REDACTED] subjects.

## 2.0 Data Analysis Considerations

### 2.1 Types of Analyses

Analyses will consist of summarizing efficacy and safety data. Unless otherwise stated, two-sided p-values  $<0.10$  will be considered as statistically significant.

The following standards will be applied for the analyses unless otherwise specified. Simple summary statistics (descriptive statistics) for continuous data are: n (number of non-missing observations), mean, median, standard deviation, minimum, and maximum. The frequency count and percentage will be used to summarize categorical data. Summary statistics will be presented by treatment.

Statistical tests of each efficacy endpoint will be conducted as described in Section 4.2.

All data collected will be presented in the by-subject data listings, sorted by subject and by time point, where appropriate.

### 2.2 Analysis Populations

The following analysis populations will be defined for the study:

**Intention to Treat (ITT):** The ITT analysis set will consist of all subjects who have been randomized to receive either D-PLEX or SOC. In this analysis set, treatment will be assigned based on the treatment to which subjects were randomized, regardless of which treatment they actually receive.

**Safety:** The safety analysis set will consist of all subjects who have been randomized and treated. In this population, treatment will be assigned based upon the treatment subjects actually receive, regardless of the treatment to which they were randomized.

**Modified Intent to Treat (mITT):** The mITT analysis set is a subset of the ITT set and will consist of all subjects randomized and treated with D-PLEX or SOC, for whom there is at least valid post-surgical observations on the primary endpoint and meet all inclusion/exclusion criteria. The exclusion from the mITT population will be determined prior to database lock.

**Per Protocol (PP):** The PP analysis set will include all ITT subjects who have completed the study without any major protocol deviations. The exclusion from the PP population will be determined prior to database lock.

**Pharmacokinetic (PK):** The PK analysis set will consist of all subjects who have been randomized, treated with D-PLEX, and have had PK sampling.

The analysis of primary efficacy endpoints will be performed on the ITT, mITT and PP populations as listed in Section 8.0. Analyses performed on the PP population are secondary to the analyses conducted on the ITT and mITT populations. Any additional analysis will be done on the populations as specified in Appendix B.

Analyses of safety will be performed on the safety population. Baseline subject characteristics and demographics will be summarized for the ITT population.

Analysis of pharmacokinetic variables will be performed on the PK population.

### 2.2.1 Subgroup Definitions

Analyses will be presented by treatment (D-PLEX or control), dose group (number of vials of D-PLEX), and type of surgery (open laparotomy or laparoscopic) as indicated below and shown in Appendix B.

### 2.3 Missing Data Conventions

Missing data for the primary efficacy endpoint will be imputed for the ITT analysis set. Deaths occurring within 30 days post abdominal surgery will be counted as treatment failures in the calculation of the primary efficacy endpoint for each treatment group. Subjects who have missing primary efficacy endpoint data due to other reasons will also be counted as treatment failures in the calculation of the primary efficacy endpoint for each treatment group.

There will be no imputation of missing data for the mITT analysis of the primary endpoint, and there will be no imputation of missing data for all other study endpoints (i.e., a complete case analysis will be used).

## 2.4 Interim Analyses

A blinded non-comparative sample size reassessment to evaluate the infection rate precision assumptions will be conducted after a total of [REDACTED] subjects have been assessed for the primary efficacy endpoint. The maximal sample size allowed to upsize is about [REDACTED] subjects.

Refer to the separate Interim Analysis Plan (IAP) for further details on the interim analyses.

## 2.5 Study Center Considerations in the Data Analysis

A study center is defined as a treatment administration site or group of treatment administration sites under the control and supervision of the same Principal Investigator (PI).

There will be no selective pooling of study centers in the analysis. All calculations will be made on the combined results of all centers.

## 2.6 Documentation and Other Considerations

The data analyses will be conducted using SAS® Software, version 9.4 or later.

## 3.0 Analysis of Baseline Subject Characteristics

Baseline and demographic characteristics will be summarized by treatment and overall for all subjects in the ITT population. Continuous variables will be displayed via summary statistics (mean, median, sample size, standard deviation, minimum, and maximum). Categorical variables will be summarized via counts and percentages.

A detailed listing of demographics data for each subject will also be provided as shown in Appendix B.

## 4.0 Analysis of Efficacy

### 4.1 Description of Efficacy Variables

#### 4.1.1 Primary Efficacy Variables

The primary efficacy variable for the study is the following:

- Combined infection and mortality rate which is measured by the number and proportion of subjects with either an SSI event (as determined by the blinded and independent adjudication committee, within 30 days post

abdominal surgery) or mortality for any reason within 30 days post index surgery.

SSI is composed of Deep Incisional Surgical Site Infection (DSSI) and Superficial Incisional Surgical Site Infection (SSSI). A SSSI is an infection that involves only skin and subcutaneous tissue of the incision and does not include diagnosis/treatment of cellulitis, a stitch abscess alone or a localized stab wound or pin site infection. A DSSI is an infection that involves deep tissues, such as fascia and muscle layers; this also includes infection involving both superficial and deep incision sites. The calculations and analyses pertaining to each of the above variables are shown in Section 4.2.2.

#### **4.1.2 Key Secondary and Exploratory Efficacy Variables**

Key secondary efficacy variables:

- Number of hospitalization days post colorectal surgery due to SSI
- Average ASEPIS assessment score during 30 days post-surgery
- Number of surgical interventions due to SSI
- Mortality rate within 30 days post abdominal surgery

Additional efficacy variables:

- Infection rate as measured by the proportion of subjects with an SSI event, as determined by the blinded and independent adjudication committee, within 30 days post abdominal surgery
- Incidence of SSSI rates during 30 days post-surgery
- Incidence of DSSI rates during 30 days post-surgery
- Mortality rate within 60 days post abdominal surgery
- Determination of susceptibility to Doxycycline of any organisms recovered from an abdominal surgery incisional infection site
- Number of overall hospitalization days within 60 days post-surgery
- Number of subjects who were hospitalized due to SSI
- Number of re-admissions due to surgical site infection
- Number of antibiotic treatment days due to abdominal incisional surgical site infection
- Number of subjects who received antibiotics due to SSI
- Time to surgical site infection post-surgery
- Number of non-confirmed SSI by adjudication
- Number of any SSI (confirmed and non-confirmed)

## **4.2 Analysis of Efficacy Variables**

### **4.2.1 Primary Efficacy Analysis**

The number and proportion of subjects with at least one SSI, as determined by a blinded and independent adjudication committee, within 30 days post abdominal surgery, or mortality for any reason within 30 days post index surgery, will be tabulated per treatment group and surgery type. If a subject is presented to the blinded and independent adjudication committee, the SSI will be considered to have taken place within 30 days of treatment. A 95% confidence interval using exact binomial methods will be constructed for each proportion. A two-sided Fisher's Exact Test will be conducted to test for a significant difference in the infection proportions between treatment groups and surgery types. The same analysis will be performed by treatment group only.

This analysis of the primary efficacy variable will be performed on the ITT population and a secondary analysis of the primary efficacy variable will be performed on the mITT and PP populations.

Missing data for the primary efficacy endpoint will be imputed according to the methods described in section 2.3

#### **4.2.2 Secondary and Exploratory Efficacy Analyses**

Secondary efficacy analyses will be conducted on the ITT and mITT population. Selected analyses will also be performed on the PP population, as stated below.

##### **4.2.2.1 Key Secondary Efficacy Analyses**

###### **Hospitalization Days Due to SSI**

For both initial and additional hospitalization events, the number of hospitalization days due to surgical site infection will be summarized by treatment group using descriptive statistics. A Wilcoxon Rank Sum Test will be conducted to assess for treatment group differences.

###### **Average ASEPSIS Assessment Scores**

The total ASEPSIS assessment score will be summarized by treatment group and visit, and by treatment group only, using descriptive statistics. Additionally, the cumulative ASEPSIS assessment score (includes all scores within 30 days of treatment) will also be summarized by treatment group using descriptive statistics. An additional analysis of the subset of subjects who experience at least one SSI will also be summarized by treatment group and visit using descriptive statistics. All descriptive statistics will include data from both scheduled and unscheduled visits. A Wilcoxon Rank Sum Test will be conducted to assess for treatment group differences for both the total and cumulative ASEPSIS assessment scores.

###### **Surgical Interventions Due to SSI**

The number of surgical interventions due to surgical site infection will be summarized by treatment group using descriptive statistics. A Wilcoxon Rank Sum Test will be conducted to assess for treatment group differences.

**Mortality Rate within 30 Days**

The number and proportion of subjects who experience death for any reason within 30 days post abdominal surgery will be presented by treatment. A two-sided Fisher's Exact Test will be conducted to test for a significant difference in the infection proportions between treatment groups.

**4.2.2.2 Additional Secondary Efficacy Analyses****Infection Rate**

The number and proportion of subjects with at least one SSI, as determined by a blinded and independent adjudication committee, within 30 days post abdominal surgery will be tabulated per treatment group. A two-sided Fisher's Exact Test will be conducted to test for a significant difference in the infection proportions between treatment groups.

**Incidence of SSSI Rate**

The number and proportion of subjects who experience at least one SSSI within 30 days post abdominal surgery will be presented by treatment. A two-sided Fisher's Exact Test will be conducted to test for a significant difference in the infection proportions between treatment groups.

**Incidence of DSSI Rate**

The number and proportion of subjects who experience at least one DSSI within 30 days post abdominal surgery will be presented by treatment. A two-sided Fisher's Exact Test will be conducted to test for a significant difference in the infection proportions between treatment groups.

**Mortality Rate within 60 Days**

The number and proportion of subjects who experience death for any reason within 60 days post abdominal surgery will be presented by treatment. A two-sided Fisher's Exact Test will be conducted to test for a significant difference in the infection proportions between treatment groups.

**Bacterial Growth Susceptibility to Doxycycline**

The number of subjects who have bacterial growth analyzed will be summarized by treatment group. The number and proportion of subjects who experience bacterial growth will be summarized by treatment group, isolate and sensitivity to Doxycycline. A two-sided Fisher's Exact Test will be conducted to test for a significant difference in the infection proportions between treatment groups for isolate and bacterial growth presence.

**Overall Hospitalization Days**

The number of overall hospitalization days within 60 days post-surgery will be summarized by treatment group using descriptive statistics. Hospitalization days will be counted as aggregated overall hospitalization days (including post-operation hospitalizations and hospitalizations due to SAEs) per subject. A Wilcoxon Rank Sum Test will be conducted to assess for treatment group differences.

**Subject Hospitalization**

The number and proportion of subjects who were hospitalized due to SSI within 30 days and within 60 days post-surgery will be presented separately by treatment. A two-sided Fisher's Exact Test will be conducted to test for a significant difference in the proportions between treatment groups. This analysis will be performed on the ITT, mITT, and PP populations.

**Re-admission Due to Surgical Site Infection**

The number and proportion of subjects who experience re-admission due to SSI will be presented by treatment. A two-sided Fisher's Exact Test will be conducted to test for a significant difference in the re-admission proportions between treatment groups.

**Antibiotic Treatment Days**

The number of antibiotic treatment days due to abdominal incisional surgical site infection (SSI) will be summarized by treatment group using descriptive statistics. Data will be aggregated and presented for overall days of antibiotic treatment (all routes of administration) and for number of days of IV antibiotic administration.

**Subjects Receiving Antibiotics**

The number and proportion of subjects who receive antibiotics due to SSI will be presented by treatment. A two-sided Fisher's Exact Test will be conducted to test for a significant difference in the proportions between treatment groups. This analysis will be performed on the ITT, mITT, and PP populations.

**Time to Surgical Site Infection Post-Surgery**

Time to surgical site infection for the D-PLEX treatment group will be compared to that of the SOC treatment group using a Gehan-Wilcoxon test. The comparison will also be depicted using Kaplan-Meier curves.

**Non-confirmed SSI by Adjudication**

The number and proportion of subjects who experience at least one SSI that was not confirmed upon adjudication will be presented by treatment. A two-sided Fisher's Exact Test will be conducted to test for a significant difference in the non-confirmed SSI proportions between treatment groups.

**Any SSI (Confirmed and Non-confirmed)**

The number and proportion of subjects who experience at least one SSI, regardless of whether it was confirmed upon adjudication, will be presented by treatment. A two-sided Fisher's Exact Test will be conducted to test for a significant difference in the SSI proportions between treatment groups.

All secondary efficacy data will be listed as shown in Appendix B.

## 5.0 Analysis of Pharmacokinetics

### 5.1 Description of Pharmacokinetic Variables

Doxycycline pharmacokinetic (PK) sampling will be collected from [REDACTED] subsets administered with different doses of D-PLEX (1, 2, or 3 vials) in at least [REDACTED] subjects (i.e., [REDACTED] subjects per subset, pending subset recruitment). For subjects where D-PLEX was re-applied due to re-intervention, PK sampling should be stopped, and the reason stated on their PK collections form.

Pharmacokinetic samples of 4mL blood will be collected, prepared, and shipped to a central laboratory at the following time points: pre-application of D-PLEX, after application of D-PLEX, 2-, 4-, 6-, 8-, 12-, 24-hours, 120 hours (Day 5), 336 hours (Day 14), and 720 hours (Day 30) following the application of D-PLEX. Additional samples may be taken at the 48- and 72-hour time points if the subject is still hospitalized following surgery.

The following PK parameters will be estimated for each subject:

PK Parameter	Definition
$C_{max}$	Maximum observed plasma concentration
$t_{max}$	Time of maximum observed plasma concentration; if it occurs at more than one time point, $T_{max}$ is defined as the first time point with this value
$AUC_{0-t}$	Cumulative area under the plasma concentration time curve calculated from 0 to the last measured plasma concentration using the linear trapezoidal method
$AUC_{0-\infty}$	Area under the plasma concentration time curve extrapolated to infinity, calculated as $AUC_{0-T} + C_{LQC}/\lambda_z$ , where $C_{LQC}$ is the measured concentration at time $T_{LQC}$
$\lambda_z$	Apparent elimination rate constant, estimated by linear regression of the terminal linear portion of the log concentration versus time curve
$t_{1/2}$	Terminal elimination half-life, calculated as

	$\ln(2)/\lambda_z$
$V_z$	Steady-state distribution volume based on the last observed concentration
MRT	Mean residence time from the time of dosing to the time of the last measurable concentration

## 5.2 Analysis of Pharmacokinetic Variables

Plasma sample Doxycycline concentrations will be summarized by dose group and time point using descriptive statistics.

The concentrations will be depicted for each subject by dose group using linear scale. Mean and median doxycycline concentrations will also be depicted by dose group, for each time point, in linear scale.

PK parameter values will be summarized by dose group using descriptive statistics (n, mean, standard deviation, CV%, geometric mean, and 90% confidence interval).

## 6.0 Analysis of Safety

The safety variables for this study are:

- Adverse events (AE)
- Vital Signs
- Physical Examination (at screening, day 30 and day 60)
- Laboratory Results
- Wound Healing assessment by blinded assessor

### Adverse Events

Prior to analysis, all AEs will be coded using the MedDRA coding dictionary. Treatment-emergent AEs (TEAEs) are those AEs that start on the day of or after study treatment administration. The number and percentage of subjects with at least one TEAE will be summarized by system organ class (SOC) and by preferred term (PT) within SOC for each treatment group. Similar summary tables will be provided to display the number and percentage of subjects with at least one serious TEAE (SAE) and at least one study drug-related TEAE by SOC and

by PT within SOC. For the purposes of this study, a study drug-related TEAE is any TEAE with a relationship to study drug of possibly related or related.

In addition, tables will be constructed to summarize TEAEs by relation to study drug and by severity.

A summary table with the count and percentage of subjects exhibiting an AE due to delay of wound healing will be created by treatment and overall.

All AEs will be listed, regardless of whether they were treatment emergent. AEs having an end date prior to signing the informed consent for this study will not be displayed in the AE data listings.

### **Vital Signs**

Summary statistics (mean, median, sample size, standard deviation, minimum, and maximum) will be computed on the raw and change from baseline values for each vital sign parameter by time point, for each treatment. The Day 0 prior to treatment time point will serve as baseline. If there are multiple vital signs taken at any time point, then the latest set of vital signs will be used for the analysis. All vital sign data will be listed.

### **Physical Exam**

The number and proportion of subjects with abnormal physical examination findings will be summarized by body system. A physical exam (PE) shift table will be constructed for each treatment group to identify the changes in body system findings from pre-treatment to each post-treatment time point where PE is performed (Days 30 and 60).

### **Laboratory Results**

Summary statistics (mean, median, sample size, standard deviation, minimum, and maximum) will be computed on the raw and change from baseline values for each laboratory parameter by time point, for each treatment. The screening time point will serve as baseline. Shift tables will be constructed to show the changes in laboratory findings from pre-treatment to each post-treatment time point.

### **Wound Healing Assessment**

The number and proportion of subjects who achieved a wound healing (Y/N) will be calculated by treatment and visit. Additionally, the count and proportions of the assessment response will be displayed by treatment and visit.

## **7.0 Other Relevant Data Analyses/Summaries**

### **7.1 Subject Disposition**

A table will be constructed with counts of screen failures and enrolled subjects. Of those enrolled, counts and percentages of the number of subjects withdrawing

from the study before study completion and the number completing the study will be displayed. For those subjects that withdraw before completion of the study, counts and percentages of the reasons for withdrawal will be tabulated. The table will include summary counts and percentages by treatment. A data listing of all subject completion and withdrawal data will also be constructed.

## **7.2 Bacteriological Testing**

A table will be constructed with the number and proportion of subjects with abnormal results reported from the bacteriological test will be summarized by treatment.

Additionally, the number and percent of bacteria resistant to antibiotics other than Doxycycline will be summarized by treatment and overall.

Bacterial growth will be analyzed for subjects who experience SSI with the count and percentage of microorganisms presented by treatment and overall. A data listing of all microorganisms identified will also be constructed.

## **7.3 Medical History**

Prior to analysis, all medical history terms will be coded using the MedDRA coding dictionary. The number and percentage of subjects with at least one medical history term will be summarized by system organ class (SOC) and by preferred term (PT) within SOC for each treatment group. A complete medical history of past and present illnesses and surgeries will be listed.

## **7.4 Concomitant Medication**

All concomitant medications will be coded with the WHO Drug Dictionary. A table will be constructed with counts and percentages of subjects by ATC level 4 and preferred term. Additional analysis will be performed for antibiotics that were taken prior to and after surgery. A table will be constructed with counts and percentages of subjects by ATC level 4 and preferred term.

## **7.5 Wound Characteristics and Surgery Type**

A table will be constructed with the number and proportion of subjects to analyze wound characteristics and surgery type. The length of surgical incision, type of surgery, and surgery with or without stoma will be summarized by treatment and overall. An additional analysis of the subset of subjects who experience SSI will also be summarized by treatment group and overall.

## 8.0 List of Analysis Tables, Figures and Listings

Table No.	Table Title	Included in Final Tables	Shown in Appendix B
1	Subject Disposition	X	X
2	Demographics and Baseline Data Summary Statistics--Continuous Variables (Safety Population)	X	X
3	Demographics and Baseline Data Summary Statistics--Categorical Variables (Safety Population)	X	X
4	Number and Proportion of Subjects who Experience SSI or Mortality within 30 Days (ITT Population)	X	X
5	Number and Proportion of Subjects who Experience SSI or Mortality within 30 Days (mITT Population)	X	
6	Number and Proportion of Subjects who Experience SSI or Mortality within 30 Days (PP Population)	X	
7	Number and Proportion of Subjects who Experience SSI or Mortality within 30 Days by Type of Surgery (ITT Population)	X	X

## **9.0 References**

Not applicable.

## Appendix A – Tables, Figures and Listing Specifications

### Orientation

Tables, figures, and listings will be displayed in landscape.

### Margins

Margins will be 1 inch on all sides. Table, figure, and listing boundaries will not extend into the margins.

### Font

Courier New, 8 point.

### Headers

The table number will be on the second line of the title area. The title area will contain the Sponsor name, the study number, and the name of the table. The title area will contain the page number (Page x of y) on the far right, one line above the name of the table.

### Footers

- The first line will be a solid line.
- Next will be any footnotes regarding information displayed in the table.
- Below these footnotes will be displayed “STATKING Clinical Services (month day, year)” on the far left.
- The last line will display the name of the SAS program that generated the table and (if applicable) the source data reference.

### Table Disclaimer

The format of the mock tables shown in the appendix of this Statistical Analysis Plan (SAP) will be the format of the deliverable tables to the extent that Word document constructed tables can match production tables produced by SAS. This formatting includes the content and format of the header and footer areas of the tables. The Sponsor agrees to the format of the tables as shown in the appendix.

Further programming charges will be applicable for changes in the format of tables (including title statements, notes, data dependent footnotes, etc.) made after the approval of the SAP.

**Missing Values**

All missing values will be displayed on the output tables/listings as blanks.

**Computation Values for Study Dates**

The date format to be used is dd-mmm-yyyy. Missing parts of dates are not shown (e.g., for a missing day value, the value displayed is in mmm-yyyy format).

## Appendix B – Table Shells

Table 1. Subject Disposition  
PolyPid Ltd. - Study No. D-PLEX 310

	D-PLEX (N=xxx) <sup>a</sup>	CONTROL (N=xxx) <sup>a</sup>	Overall (N=xxx) <sup>a</sup>
Screen Failures			xx
Enrolled	xx	xx	xx
Completed	xx (xxx)	xx (xxx)	xx (xxx)
Discontinued	xx (xxx)	xx (xxx)	xx (xxx)
Reason for Discontinuation			
Adverse Event	xx (xxx)	xx (xxx)	xx (xxx)
Lost to Follow-up	xx (xxx)	xx (xxx)	xx (xxx)
Death	xx (xxx)	xx (xxx)	xx (xxx)
Consent Withdrawn	xx (xxx)	xx (xxx)	xx (xxx)
Other	xx (xxx)	xx (xxx)	xx (xxx)

<sup>a</sup> The denominator for all percentages in the table is the number of enrolled subjects in the corresponding treatment group and overall.
