1. Abstract

Title

Analysis of the clinical experience with rucaparib in the rucaparib access program (RAP) in Spain – A GEICO Study

Keywords

Rucaparib, rucaparib access program, ovarian cancer

Rationale and background

Rucaparib is a PARP-1/2/3 inhibitor approved for the treatment of high-grade ovarian cancer. In ARIEL3, rucaparib improved progression-free survival (PFS) as maintenance therapy for platinum (Pt)-sensitive recurrent ovarian cancer. Study 10, ARIEL2, and ARIEL4 showed rucaparib's benefit as treatment.

Research question and objectives

An observational study (GEICO 87-R) was performed in high-grade ovarian cancer patients treated within the rucaparib access program (RAP) in Spain. The aim was to better understand rucaparib's management in real-life setting, to optimize future use, considering Pt-sensitive and Pt-resistant BRCAmut treatment and maintenance patients.

Study design

A retrospective study was performed at 22 GEICO hospitals in Spain that treated patients within RAP (600 mg BID) since September 2018. Adult women with high-grade epithelial ovarian, fallopian tube, or primary peritoneal cancer, with medical record available, were included. Patient characteristics, medical history, safety, efficacy, and dosing data were collected.

Setting

The setting of this observational study was rucaparib's access program (RAP) in Spain, in the context of real-life use of the product.

Subjects and study size, including dropouts

The study recruited adult (18 years or more) women according to the following criteria:

Inclusion criteria:

- 1.- Written informed consent must be signed by all patients participating in the study who can be interviewed in the hospital (accessible, alive patients). Informed consent may not be required from unaccessible patients (dead, lost, etc.) according to ethics committee permissions and applicable law for retrospective studies in Spain.
- 2.- Histological diagnosis of high-grade epithelial ovarian, fallopian tube, or primary peritoneal cancer treated in the context of rucaparib access program (RAP) in Spain.

3.- Adult women (18 years or more at the time of diagnosis).

Exclusion criteria:

1.- Patients without medical record available (lost, empty or un retrievable clinical information).

The study will include up to 70 patients in total (retrospective in all cases). The population will include all patients who received at least one dose of rucaparib as part of the RAP in GEICO-associated hospitals. The sample size will be based on the accrual rate of the RAP and the date of rucaparib launch in Spain. There will be no formal calculation of the sample size. All patients included in the RAP between September 2018 and the date of the rucaparib launch in Spain will be analyzed.

Variables and data sources

- Patient characteristics and medical history: Sex, age, mutational status (BRCA 1/2 [germline/somatic] and in other HRR genes), number of previous relapses, number of previous chemotherapy regimens, types of treatments received (chemotherapy, targeted therapies [bevacizumab, PARPi]), prior maintenance or with maintenance, treatment-free interval (platinum-based chemotherapy, non-platinum-based chemotherapy, targeted therapy).
- Rucaparib safety data: all rucaparib-related hematological and non-hematological, serious and non-serious adverse events (grade, start date, end date, action taken with rucaparib, outcome); others (GI, HBP, cognitive, and psychological sphere). In addition, adverse event treatments will be registered in the study database.
- Rucaparib efficacy data: best response rates in the treatment indication patients, duration of response and PFS in the treatment indication patients, PFS in the maintenance indication patients, radiological response to chemotherapy in maintenance patients (and impact of response on patient evolution).
- Rucaparib dosing data: mean starting dose, number of dose reductions, reasons for reductions, number of treatment discontinuations, reasons for discontinuations, duration of treatment, and switching of maintenance therapy to another PARP inhibitor (including reasons for switching).
- In order to show that data obtained in clinical trials could be reproduced in non-screened patients, the outcomes will be discussed in the context of the results from ARIEL3 trial and the integrated analysis of Study 10 and ARIEL2.

These data are to be obtained from the participating hospitals per local practice (clinical records, local reports).

Results

Between July 2020 and February 2021, 51 patients were recruited with median age 63 years (36-86). At diagnosis, 45.1% of patients harbored gBRCA mutations, 19.6% sBRCA mutations, and 31.4% were BRCAwt. Before rucaparib, patients had ECOG performance status 0, 1, or 2 (37.3%, 49.0%, and 5.9%) and 72.5% had measurable disease. The median number of previous lines was 4 (1-9), 51.0% of patients received prior bevacizumab, and notably 25.5% of patients had received a prior PARPi. Rucaparib was given as maintenance, Pt-resistant, and Pt-sensitive treatment in 35.3%, 51.0%, and 13.7% of patients respectively (median dose 550.0 mg [299-600]). 91.3% of

patients received rucaparib for ≤ 12 months and 8.7% > 12 months. 50.0% had at least one dose reduction and 60.0% at least one dose interruption. 9.8% discontinued due to rucaparib toxicity and 5 patients remained on treatment upon analysis. Median PFS was 6.0 months (95% CI 2.5-7.8). For treatment group (19 radiologically-evaluable pts), the disease control rate was 42.0% (21.0% PR and 21.0% SD). Overall, 86.3% of patients had rucaparib-related toxicities, while most common G3-4 hematological events were anemia (13.7%), neutropenia (5.9%), and thrombocytopenia (5.9%).

Discussion

Rucaparib's safety profile in real-life setting is manageable and efficacy results, even considering heavily pre-treated patients, are comparable to those of previous trials. The RAP in Spain showed a consolidated management of rucaparib and, consequently, an improved safety profile.

5. Milestones

Milestone	Planned date	Actual date	Comments
Start of data collection	15 July 2020	29 July 2020	
End of data collection	15 December 2020	25 May 2021	Includes data cleaning period. Delay caused by the need of issuing additional queries.
Final report of study results	31 March 2021	29 July 2021	

6. Rationale and background

Rucaparib is a small molecule inhibitor of PARP-1, PARP-2, and PARP-3 that has demonstrated preclinical and clinical activity in epithelial ovarian cancer with deleterious mutations in BRCA1/2 or other HRR gene and/or high level of genomic LOH.

Rucaparib was approved by the U.S. FDA in December 2016 for the treatment of patients with advanced ovarian cancer with BRCA mutation (germline and/or somatic) who have been treated with two or more chemotherapies (1, 2). Rucaparib approval was based on the proportion of patients with an observed objective response in a pooled population of patients with BRCA-mutated high-grade ovarian carcinoma from clinical studies Study 10 and ARIEL2 (3, 4).

More recently, the results of the Phase 3 ARIEL3 clinical trial demonstrated that rucaparib improves PFS as maintenance therapy for patients with platinum-sensitive recurrent ovarian cancer (5).

An additional Phase 3 clinical trial, ARIEL4, is currently enrolling patients with relapsed BRCA-mutated high-grade ovarian cancer who have received at least two prior chemotherapy regimens (6).

Rucaparib is indicated in Europe:

- As monotherapy for the maintenance treatment of adult patients with platinum-sensitive relapsed high-grade epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in response (complete or partial) to platinum-based chemotherapy.
- As monotherapy treatment of adult patients with platinum-sensitive, relapsed or progressive, BRCA mutated (germline and/or somatic), high-grade epithelial ovarian, fallopian tube, or primary peritoneal cancer, who have been treated with two or more prior lines of platinum-based chemotherapy, and who are unable to tolerate further platinum-based chemotherapy.

The Rucaparib Access Program (RAP) currently provides the drug for these licensed indications. In addition, the RAP also provides rucaparib as off-label use for patients with a special clinical need which cannot be satisfied by a licensed medication: Patients with relapsed or progressive, BRCA mutated (germline and/or somatic), high-grade epithelial ovarian, fallopian tube, or primary peritoneal cancer, who have been treated with two or more prior lines of platinum-based chemotherapy, and who are currently platinum-resistant and require treatment with rucaparib.

This program has been active in Spain since September 2018. More than 60 patients have been included until now.

An observational study (GEICO 87-R) was proposed in high-grade ovarian cancer patients treated within the rucaparib access program (RAP) in Spain. The aim was to better understand rucaparib's management in real-life setting, to optimize future use, considering platinum-sensitive and platinum-resistant BRCAmut treatment and maintenance patients.

7. Research questions and objectives

The general aim of this study was to better understand and optimize rucaparib's future clinical management in patients with high-grade epithelial ovarian, fallopian tube, or primary peritoneal cancer treated in the context of rucaparib access program (RAP) in Spain.

To this end, a clinical database was built including clinical data in three scenarios of rucaparib treatment: (1) platinum-sensitive BRCA-mutated patients after progression, (2) maintenance therapy in patients after a platinum-sensitive relapse in response, and (3) treatment therapy in BRCA-mutated patients who were platinum-resistant.

The specific objectives of the study were:

- To describe patient characteristics/medical history, safety, efficacy, and dosing of on-label treatment with rucaparib in real-world patients (real-world data).
- To describe patient characteristics/medical history, safety, efficacy, and dosing of all patients treated with rucaparib (including patients with on-label treatment and others) in real-world patients (real-world data).
- To show that data obtained in clinical trials could be reproduced in non-screened patients.

8. Amendments and updates

No amendments were performed to the study protocol.

9. Research methods

9.1 Study design

The study consisted of a retrospective observational, multicenter study in which the fundamental exposure factor being investigated was a drug (rucaparib). The study was developed at national level with the initial intention of including nearly 27 sites in Spain, during a data collection period of 3 months.

9.2 Setting

The setting of this observational study was rucaparib's access program (RAP) in Spain, in the context of real-life use of the product.

9.3 Subjects

The study recruited adult (18 years or more) women according to the following criteria:

Inclusion criteria:

- 1.- Written informed consent must be signed by all patients participating in the study who can be interviewed in the hospital (accessible, alive patients). Informed consent may not be required from unaccessible patients (dead, lost, etc.) according to ethics committee permissions and applicable law for retrospective studies in Spain.
- 2.- Histological diagnosis of high-grade epithelial ovarian, fallopian tube, or primary peritoneal cancer treated in the context of rucaparib access program (RAP) in Spain.
- 3.- Adult women (18 years or more at the time of diagnosis).

Exclusion criteria:

- 1.- Patients without medical record available (lost, empty or unretrievable clinical information).

9.4 Variables

- Patient characteristics and medical history: Sex, age, mutational status (BRCA 1/2 [germline/somatic] and in other HRR genes), number of previous relapses, number of previous chemotherapy regimens, types of treatments received (chemotherapy, targeted therapies [bevacizumab, PARPi]), prior maintenance or with maintenance, treatment-free interval (platinum-based chemotherapy, non-platinum-based chemotherapy, targeted therapy).
- Rucaparib safety data: all rucaparib-related hematological and non-hematological, serious and non-serious adverse events (grade, start date, end date, action taken with rucaparib, outcome); others (GI, HBP, cognitive, and psychological sphere). In addition, adverse event treatments will be registered in the study database.
- Rucaparib efficacy data: best response rates in the treatment indication patients, duration of response and PFS in the treatment indication patients, PFS in the maintenance indication patients, radiological response to chemotherapy in maintenance patients (and impact of response on patient evolution).
- Rucaparib dosing data: mean starting dose, number of dose reductions, reasons for reductions, number of treatment discontinuations, reasons for discontinuations,

duration of treatment, and switching of maintenance therapy to another PARP inhibitor (including reasons for switching).

- In order to show that data obtained in clinical trials could be reproduced in non-screened patients, the outcomes will be discussed in the context of the results from ARIEL3 trial and the integrated analysis of Study 10 and ARIEL2.

9.5 Data sources and measurement

The data collected in this study included family history characteristics, clinical-pathological features of the tumor, treatment approaches, and long-term outcomes. These data were obtained from the participating hospitals per local practice (clinical records, local reports).

9.6 Bias

Since this was a retrospective observational study, no sources of bias were identified.

9.7 Study size

The study initially planned to include up to 70 patients in total (retrospective in all cases). The population included all patients who received at least one dose of rucaparib as part of the RAP in GEICO-associated hospitals. The sample size was based on the accrual rate of the RAP and the date of rucaparib launch in Spain. There was no formal calculation of the sample size. All patients included in the RAP between September 2018 and the date of the rucaparib launch in Spain were analyzed.

9.8 Data transformation

Stratification Factors

Data was stratified by age subgroups (<70 years vs ≥70 years).

Patients Characteristics

The information of patients such as age, sex, race and other baseline characteristics were summarized.

Exposure

All data collected that was not free text was reported: mean starting dose, number of dose reductions, reasons for reductions, number of treatment discontinuations, reasons for discontinuations, duration of treatment, and switching of maintenance therapy to another PARP inhibitor (including reasons for switching).

Concomitant Medications (CMs) and Medical History (MH)

The CMs were presented in the summary using frequency counts and percentages stratified by whether they occurred before or during rucaparib. When summarizing the number and percentage of subjects with some concomitant medications, subjects with multiple occurrences of the same CM were counted only once.

In MH all data collected that was not free text was reported: mutational status (BRCA 1/2 [germline/somatic] and in other HRR genes), number of previous relapses, number of previous chemotherapy regimens, types of treatments received (chemotherapy, targeted therapies [bevacizumab, PARPi]), prior maintenance or with maintenance, treatment-free interval (platinum-based chemotherapy, non-platinum-based chemotherapy, targeted therapy).

Initial Ovarian Cancer Diagnosis

The information of initial diagnosis such as age, tumor histology, FIGO stage, and mutational status was summarized.

Ovarian Cancer Treatments (Previous Surgeries)

All the data collected was summarized as the number of previous surgeries and time from the last previous surgery to rucaparib (categorically and numerically).

Ovarian Cancer Treatments (Previous Systemic Treatments)

All data collected other than free text was reported: total number of previous lines, total number of each type of treatment received per patient, time from last previous systemic treatment to rucaparib. In addition, the last line prior to rucaparib was listed as well as the duration, time passed between the last previous line and rucaparib and time to progression.

Progression-Free Survival (PFS)

PFS: Measured in months from the date of the first dose to the date of the first progression (PD) (whether radiological, clinical or biological) or to the date of death from any cause, whichever occurs first.

Objective Response Rate (ORR)

ORR: Confirmed best overall tumor response of CR or PR according to RECIST v1.1 or Response and normalization or Response according to Rustin criteria. The RECIST v1.1 answer prevailed over the Rustin criterion answer except where RECIST is 'Not assessable' and Rustin criterion is different than 'Not assessable'.

ORR was calculated only on the treatment population and not on the maintenance population.

Duration of Response (DoR)

DoR: Defined as time in months from date of documentation of tumor response (CR or PR) to date of disease progression. DoR was calculated only on the treatment population and not on the maintenance population.

The patients were listed indicating the response and the duration of the response in months.

Adverse Events (AEs)

The AEs were presented in the summary using counts and frequency percentages. They were stratified by grade and event, by time from rucaparib initiation, grade and event, and by event duration, grade and event. The number of events and the number of patients and percentage who had that event was indicated.

Clinical Laboratory Evaluations

Laboratory raw variables collected in the baseline visit will be summarized.

9.9 Statistical methods

9.9.1 Main summary measures

All variables were summarized separately. Depending on the type of the variable, the following statistics were reported:

- Continuous variables: number of subjects (n), number of missings, mean, standard deviation (STD), median, standard error (SE, if needed), 25th and 75th percentiles, minimum, and maximum.
- Categorical variables: frequencies and percentages (calculated over the number of non-missing values).

In general, minimum and maximum were reported using the same number of decimal places as collected in the raw data. Mean, STD, median, 25th and 75th percentiles were reported with one additional decimal place.

9.9.2 Main statistical methods

Time to event data were listed and summarized at every specified timepoint using the number patients at risk, number of patients censored, number of patients with the event, Kaplan Meier estimate (%), and the 95% confidence interval. In addition, 25th, 50% and 75th percentiles from Kaplan-Meier (KM) curves were used.

Time to event data was also represented graphically including KM curves, number of patients at risk and the KM medians. Censored patients were only be represented on the KM curves (+).

For ORR the rate and corresponding exact binomial confidence intervals were used in the analysis. In the calculation of the confidence intervals, PR, CR and SD were taken into account as a single category.

For continuous efficacy variables such as PFS, their medians were used. Association between variables were measured and tested by conventional statistical analysis: Pearson and/or Spearman tests.

9.9.3 Missing values

No imputation of missing data was performed.

9.9.4 Sensitivity analyses

Not applicable.

9.9.5 Amendments to the statistical analysis plan

No amendments were made to the initial statistical analysis plan.

9.10 Quality control

Each study site was subject to remote clinical monitoring and review by the ethics committees.

The study data was reviewed and cleaned by periodic inspection of the e-CRFs. Remote reviews were performed with enough frequency to ascertain the following:

- Integrity and accuracy of data:
 - Informed consent (version, signature and date)
 - Eligibility criteria
- e-CRF completion.
- Protocol deviations according GCPs and the applicable regulatory local requirements. Taking appropriate action to prevent recurrence to the detected deviations.
- Compliance with approved protocol and all approved amendments, if any.
- That the investigator receives all documents needed to conduct the study properly and to comply with the applicable regulations.
- That the investigator and local staff are adequately informed about the study through telephone initiation visits.

The study appointed CRO reviewed the e-CRFs for compliance with the protocol, and for inconsistent or missing data. When any missing data or data anomalies were found, queries were sent to the relevant center for resolution. Following the required reviews, the e-CRF data items were exported into the clinical study database for statistical analysis.

DoR has been calculated taking into account the best response date
(PR or CR) during Rucaparib until progression or follow-up date.
Only patients with PR or CR as best overall response

10.4 Main results

Between July 2020 and February 2021, 51 patients were recruited with median age 63 years (36-86). At diagnosis, 45.1% of patients harbored gBRCA mutations, 19.6% sBRCA mutations, and 31.4% were BRCAwt. Before rucaparib, patients had ECOG performance status 0, 1, or 2 (37.3%, 49.0%, and 5.9%) and 72.5% had measurable disease. The median number of previous lines was 4 (1-9), 51.0% of patients received prior bevacizumab, and notably 25.5% of patients had received a prior PARPi. Rucaparib was given as maintenance, Pt-resistant, and Pt-sensitive treatment in 35.3%, 51.0%, and 13.7% of patients respectively (median dose 550.0 mg [299-600]). 91.3% of patients received rucaparib for ≤ 12 months and 8.7% > 12 months. 50.0% had at least one dose reduction and 60.0% at least one dose interruption. 9.8% discontinued due to rucaparib toxicity and 5 patients remained on treatment upon analysis. Median PFS was 6.0 months (95% CI 2.5-7.8). For treatment group (19 radiologically-evaluable pts), the disease control rate was 42.0% (21.0% PR and 21.0% SD). Overall, 86.3% of patients had rucaparib-related toxicities, while most common G3-4 hematological events were anemia (13.7%), neutropenia (5.9%), and thrombocytopenia (5.9%).

10.5 Other analyses

Additional analyses by age groups (less than 70 years vs. 70 years or older) available upon request.

11. Discussion

11.1 Key results

- Between July 2020 and February 2021, 51 patients were recruited with median age 63 years (36-86).
- At diagnosis, 45.1% of patients harbored gBRCA mutations, 19.6% sBRCA mutations, and 31.4% were BRCAwt.
- Before rucaparib, patients had ECOG performance status 0, 1, or 2 (37.3%, 49.0%, and 5.9%) and 72.5% had measurable disease.
- The median number of previous lines was 4 (1-9), 51.0% of patients received prior bevacizumab, and notably 25.5% of patients had received a prior PARPi.
- Rucaparib was given as maintenance, Pt-resistant, and Pt-sensitive treatment in 35.3%, 51.0%, and 13.7% of patients respectively (median dose 550.0 mg [299-600]).
- 91.3% of patients received rucaparib for ≤ 12 months and 8.7% > 12 months.
- 50.0% had at least one dose reduction and 60.0% at least one dose interruption.
- 9.8% discontinued due to rucaparib toxicity and 5 patients remained on treatment upon analysis.
- Median PFS was 6.0 months (95% CI 2.5-7.8).
- For treatment group (19 radiologically-evaluable pts), the disease control rate was 42.0% (21.0% PR and 21.0% SD).
- Overall, 86.3% of patients had rucaparib-related toxicities, while most common G3-4 hematological events were anemia (13.7%), neutropenia (5.9%), and thrombocytopenia (5.9%).

11.2 Limitations

In this study, the following limitations should be considered:

- Heterogeneous population in terms of baseline characteristics (retrospective study)
- Reliance on local testing for germline or somatic mutations
- Limited follow-up

11.3 Interpretation

This study demonstrated that rucaparib's safety profile in real-life setting is manageable and efficacy results, even considering heavily pre-treated patients, are comparable to those of previous clinical trials. The RAP in Spain showed a consolidated management of rucaparib and, consequently, an improved safety profile in the treated patients.

11.4 Generalisability

The safety and efficacy results of this study are comparable to those of previous clinical trials with rucaparib.

12. Other information

All patients participating in the study (accessible, alive patients who could be interviewed in the hospital) received a Patient Information Sheet (PIS) describing, in simple language, the goals, scope, procedures and relevant implications of the study.

The PIS integrated an Informed Consent Form (ICF) to be signed by the patient, which was indispensable for study participation (for accessible patients).

Written informed consent had to be given by each accessible/reachable patient before study initiation (prior to registration of the patient in the e-CRF). The PIS/ICF included the consent of patients for the collection and analysis of their clinical data.

Data of unaccessible/unreachable patients (dead, lost, etc.) could still be used according to the permissions of ethics committees and Spanish law, regarding the use of data in retrospective studies.

13. Conclusion

Rucaparib's safety profile in real-life setting is manageable and efficacy results, even considering heavily pre-treated patients, are comparable to those of previous trials. The RAP in Spain showed a consolidated management of rucaparib and, consequently, an improved safety profile.
