2. Abstract

This is a non-randomized, non-interventional study that is part of the *Randomized Controlled Trials Duplicated Using Prospective Longitudinal Insurance Claims: Applying Techniques of Epidemiology* (RCT-DUPLICATE) initiative (www.rctduplicate.org) of the Brigham and Women's Hospital, Harvard Medical School. It is intended to emulate, as closely as possible in healthcare insurance claims data, the REWIND trial described below. Although many features of the trial cannot be directly replicated in healthcare claims, key design features, including outcomes, exposures, and inclusion/exclusion criteria, were selected to proxy those features from the trial.

In addition to closely emulating the trial population, this study also evaluates outcomes in an expanded cohort following the eligibility criteria outlined in a set of completed emulation studies ([NCT06659744](#), [NCT07088718](#), [NCT07096063](#)) to enhance generalizability to patients typically encountered in clinical practice. Randomization cannot be emulated in healthcare claims data but was proxied through a statistical balancing of measured covariates according to standard practice. Investigators assume that the RCT provides the reference standard treatment effect estimate and that failure to replicate RCT findings is indicative of the inadequacy of the healthcare claims data for emulation for a range of possible reasons and does not provide information on the validity of the original RCT finding.

The REWIND ([NCT01394952](#)) trial is a superiority trial that evaluated the effect of dulaglutide, a glucagon-like peptide-1 receptor agonist (GLP-1-RA), vs placebo on time to first occurrence of any major adverse cardiovascular event (MACE), defined as cardiovascular death, myocardial infarction, or stroke among patients with type 2 diabetes mellitus (T2DM) with and without previous cardiovascular disease (CVD).

The database study designed to emulate the REWIND trial will be a new-user active comparative study, where we compare the effect of dulaglutide vs sitagliptin, a dipeptidyl peptidase-4 inhibitor (DPP4i), on MACE among patients with T2DM with and without previous CVD. While the REWIND trial compared dulaglutide vs placebo, we chose to use sitagliptin as an active-comparator proxy for placebo. Sitagliptin was specifically chosen because a major randomized controlled trial on cardiovascular outcomes demonstrated that the drug does not affect the cardiovascular outcomes under investigation.¹ Furthermore, clinical guidelines during the study period recommended both drug classes under investigation as second- or third-line options for glucose lowering and the drugs were similarly costly. While the trial evaluated cardiovascular mortality, the database study captures all-cause mortality.

The study will use three data sources: Optum Clinformatics, Merative MarketScan, and Medicare.

Optum: Eligible cohort entry period between September 18, 2014 to November 30, 2025.

MarketScan: Eligible cohort entry period between September 18, 2014 to September 30, 2023.

Medicare: Eligible cohort entry period between September 18, 2014 to September 30, 2020.

3. Amendments and updates

Version date	Version number	Section of protocol	Amendment or update	Reason

4. Rationale and background

The purpose of this protocol is to describe the emulation of the REWIND trial ([NCT01394952](#)) and to assess the comparative effectiveness of dulaglutide vs sitagliptin in patients typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with type 2 diabetes and overweight who might not have met eligibility criteria of the REWIND trial.

The REWIND trial enrolled 9,901 participants between July 2011 and August 2018. The trial design is event-driven to collect 1200 participants with at least one event, which assumes an annual 2.00 % event rate in the control group over a maximum follow-up period of 8 years, which would result in 90% power to detect a hazard ratio of 0.82 for cardiovascular events at a significance level of 0.05 to assess superiority.^{2,3}

Dulaglutide was approved on September 18, 2014 to improve glycemic control in adults with T2DM.⁴ On February 21, 2020 FDA approved dulaglutide to reduce the risk of major adverse cardiovascular events in adults with T2DM who have established CVD or multiple cardiovascular risk factors.⁵ In the same year, on March 9, 2020 an additional dosing regimen was approved.⁶ Finally, on November 17, 2022, dulaglutide was approved for use in pediatric patients aged 10 years and older.

Sitagliptin was specifically chosen as an active comparator that could proxy for placebo because a major randomized controlled trial on cardiovascular outcomes demonstrated that it does not affect the cardiovascular outcomes under investigation.⁷ This contrasts with other DPP4i such as saxagliptin, which has raised concerns regarding potential increased risks of heart failure,⁸⁻¹¹ and linagliptin, which is commonly prescribed for patients with renal impairment because it does not require dose modifications based on kidney function, potentially leading to increased confounding compared to sitagliptin.^{12,13} Sodium-glucose cotransporter-2 (SGLT2) inhibitors would not be a neutral comparator, as they significantly reduce clinically important kidney events, kidney failure, and cardiovascular events.¹⁴⁻¹⁷ Sulfonylureas (SUs), though inexpensive and widely used, are a poor comparator in cardiovascular outcome studies due to their association with hypoglycemia, weight gain, and channeling bias, as they are often prescribed to elderly, lower socioeconomic status patients with higher baseline cardiovascular risk, making direct comparisons to GLP-1-RAs less reliable.¹⁸

5. Research question and objectives

Table 1 Primary and secondary research questions and objective

A. Primary research questions and objectives

Objective:	To evaluate the effect of dulaglutide vs sitagliptin on the composite of myocardial infarction, stroke, or all-cause mortality in patients with T2DM with and without previous CVD when following the eligibility criteria of the REWIND trial.
Hypothesis:	We hypothesize that dulaglutide will be superior to sitagliptin at preventing MACE.
Population (mention key inclusion-exclusion criteria):	Individuals with T2DM, who are either aged 50 years or above with an established cardiovascular disease, aged 55 years or above with a subclinical cardiovascular disease, or aged 60 years or above with at least two cardiovascular risk factors.
Exposure:	Dulaglutide.
Comparator:	Sitagliptin.
Outcome:	Composite of myocardial infarction, stroke, or all-cause mortality.
Time (when follow up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.
Setting:	The outcome will be measured from inpatient hospitalizations and/or death.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the effect of dulaglutide vs sitagliptin on the composite of myocardial infarction, stroke, or all-cause mortality in patients with T2DM with and without previous CVD when expanding the eligibility criteria of the REWIND trial.
Hypothesis:	We hypothesize that dulaglutide will be superior to sitagliptin at preventing MACE.
Population (mention key inclusion-exclusion criteria):	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM.
Exposure:	Dulaglutide.
Comparator:	Sitagliptin.
Outcome:	Composite of myocardial infarction, stroke, or all-cause mortality.
Time (when follow up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.
Setting:	The outcome will be measured from inpatient hospitalizations and/or death.
Main measure of effect:	Hazard ratio.

B. Secondary research questions and objectives

Objective:	To evaluate the effect of dulaglutide vs sitagliptin on the individual components of the primary end point, i.e., myocardial infarction, stroke, or all-cause mortality in a broader patient population when expanding the eligibility criteria of the REWIND trial.
Hypothesis:	We hypothesize that dulaglutide will be superior to sitagliptin at preventing myocardial infarction, stroke, or all-cause mortality.
Population (mention key inclusion-exclusion criteria):	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM.
Exposure:	Dulaglutide.
Comparator:	Sitagliptin.
Outcome:	The individual components of the primary end point, i.e., myocardial infarction, stroke, or all-cause mortality.
Time (when follow up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.
Setting:	The outcome will be measured from inpatient hospitalizations and/or death.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of dulaglutide vs sitagliptin on the composite of myocardial infarction, stroke, hospitalization for unstable angina, coronary revascularization, or hospitalization for heart failure in a broader patient population when expanding the eligibility criteria of the REWIND trial.
Hypothesis:	We hypothesize that dulaglutide will be superior to sitagliptin at preventing myocardial infarction, stroke, hospitalization for unstable angina, coronary revascularization, or hospitalization for heart failure in a broader patient population when expanding the eligibility criteria of the REWIND trial.
Population (mention key inclusion-exclusion criteria):	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM.
Exposure:	Dulaglutide.
Comparator:	Sitagliptin.

Outcome:	Composite of myocardial infarction, stroke, hospitalization for unstable angina, coronary revascularization, or hospitalization for heart failure.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.
Setting:	The outcome will be measured from inpatient hospitalizations.

Objective:	To evaluate the effect of dulaglutide vs sitagliptin on the occurrence of heart failure hospitalizations in a broader patient population when expanding the eligibility criteria of the REWIND trial.
Hypothesis:	We hypothesize that dulaglutide will be superior to sitagliptin at preventing hospitalizations for heart failure.
Population (mention key inclusion-exclusion criteria):	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM.
Exposure:	Dulaglutide.
Comparator:	Sitagliptin.
Outcome:	Hospitalization for heart failure.
Time (when follow up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.
Setting:	The outcome will be measured from inpatient hospitalizations.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the effect of dulaglutide vs sitagliptin on the hospitalizations for unstable angina in a broader patient population when expanding the eligibility criteria of the REWIND trial.
Hypothesis:	We hypothesize that dulaglutide will be superior to sitagliptin at preventing hospitalizations for unstable angina.
Population (mention key inclusion-exclusion criteria):	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM.
Exposure:	Dulaglutide.
Comparator:	Sitagliptin.

Outcome:	Hospitalization for unstable angina.
Time (when follow up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.
Setting:	The outcome will be measured from inpatient hospitalizations.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of dulaglutide vs sitagliptin on the occurrence of coronary revascularization in a broader patient population when expanding the eligibility criteria of the REWIND trial.
Hypothesis:	We hypothesize that dulaglutide will be superior to sitagliptin at preventing the occurrence of coronary revascularization in a broader patient population when expanding the eligibility criteria of the REWIND trial.
Population (mention key inclusion-exclusion criteria):	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM.
Exposure:	Dulaglutide.
Comparator:	Sitagliptin.
Outcome:	Coronary revascularization.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.
Setting:	The outcome will be measured from inpatient hospitalizations.
Main measure of effect:	Hazard ratio.

C. Safety research questions and objectives (expanded population only):

Objective:	To evaluate the comparative effect of dulaglutide vs sitagliptin on the safety outcome of urinary tract infections in a broader patient population when expanding the eligibility criteria of the REWIND trial.
Hypothesis:	We hypothesize that dulaglutide will not have a different effect from sitagliptin.
Population (mention key inclusion-exclusion criteria):	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM and overweight.
Exposure:	Dulaglutide.
Comparator:	Sitagliptin.

Outcome:	Urinary tract infections.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.
Setting:	The outcome will be measured using diagnosis codes in an inpatient or outpatient setting that are followed by an antibiotic prescription within 7 days of the diagnosis code.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of dulaglutide vs sitagliptin on the safety outcome of serious infections in a broader patient population when expanding the eligibility criteria of the REWIND trial.
Hypothesis:	We hypothesize that dulaglutide will not have a different effect from sitagliptin.
Population (mention key inclusion-exclusion criteria):	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM and overweight.
Exposure:	Dulaglutide.
Comparator:	Sitagliptin.
Outcome:	Serious infections.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.
Setting:	The outcome will be measured using primary diagnosis codes in an inpatient setting.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of dulaglutide vs sitagliptin on the safety outcome of gastrointestinal adverse events in a broader patient population when expanding the eligibility criteria of the REWIND trial.
Hypothesis:	We hypothesize that dulaglutide will not have a different effect from sitagliptin.
Population (mention key inclusion-exclusion criteria):	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM and overweight.
Exposure:	Dulaglutide.
Comparator:	Sitagliptin.
Outcome:	Gastrointestinal adverse events.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.
Setting:	The outcome will be measured using diagnosis codes in an inpatient and outpatient setting.

Main measure of effect:	Hazard ratio.
--------------------------------	---------------

D. Additional research questions and objectives:

Objective:	To evaluate the effect of dulaglutide vs sitagliptin on negative control outcomes, including (1) hernia and (2) lumbar radiculopathy.
Hypothesis:	We hypothesize that dulaglutide will not have a different effect than sitagliptin.
Population (mention key inclusion-exclusion criteria):	Two populations: (1) Individuals with T2DM, who are either aged 50 years or above with an established cardiovascular disease, aged 55 years or above with a subclinical cardiovascular disease, or aged 60 years or above with at least two cardiovascular risk factors; and (2) individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM. In addition, patients will be excluded with recent hernia or lumbar radiculopathy prior to the follow-up time window (30 days) when studying the negative outcome hernia or lumbar radiculopathy, respectively.
Exposure:	Dulaglutide.
Comparator:	Sitagliptin.
Outcome:	Separate analyses for hernia and lumbar radiculopathy.
Time (when follow up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between study arms, nursing home admission, or start of any other GLP-1-RA.
Setting:	The outcome will be measured using diagnosis codes in an inpatient or outpatient setting.
Main measure of effect:	Hazard ratio.

6. Research methods

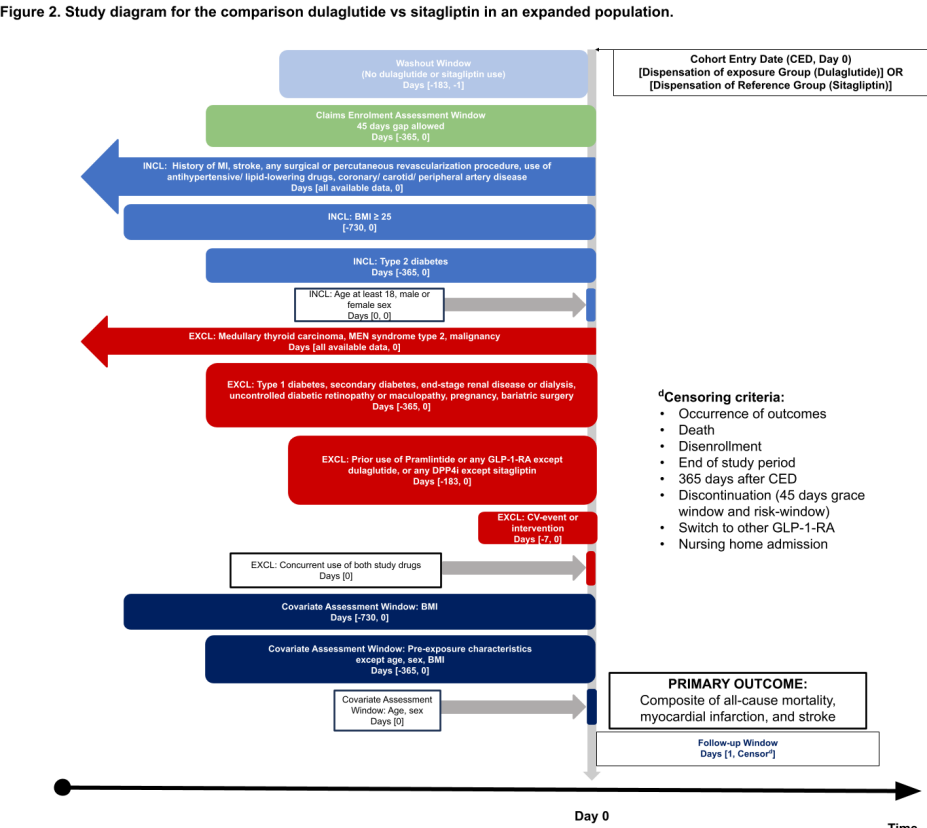

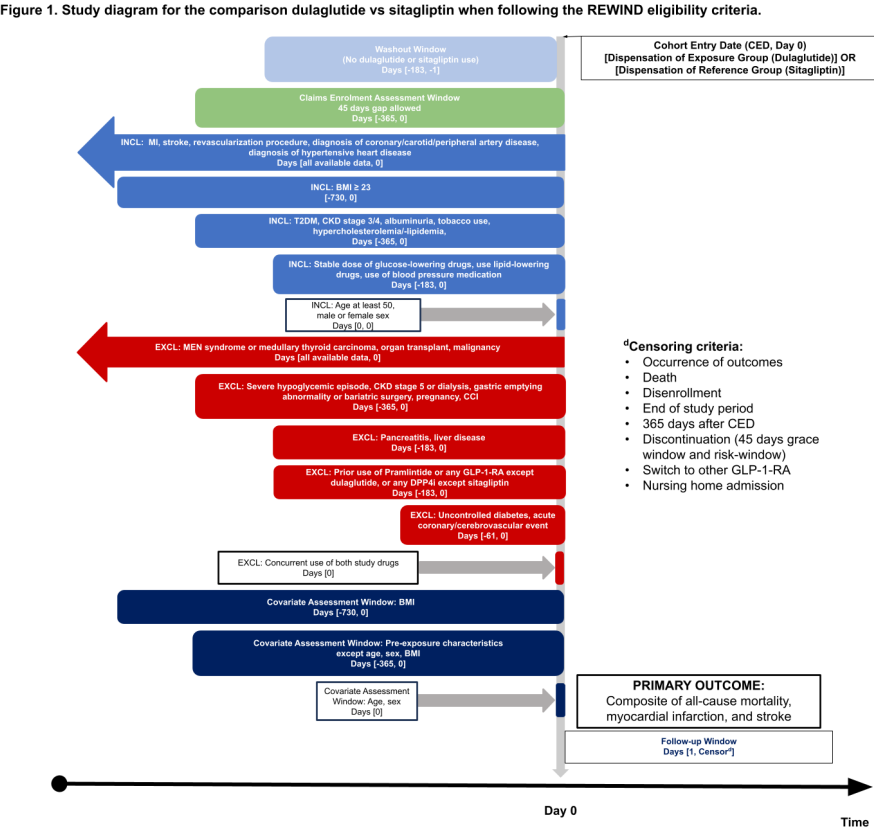

6.1 Study design

Research design (e.g. cohort, case-control, etc.): New user active comparator cohort study.

Rationale for study design choice: A new user active comparator cohort study is a powerful design that may be able to address confounding by indication. It accomplishes this, in large part, through judicious selection of an appropriate active-comparator group.^{19,20} While selection of an

appropriate comparator in the design phase is crucial, cohort studies often require additional adjustment of measurable confounders. A common method for adjusting for confounding is via a propensity score (PS).

6.2 Study design diagram when following the eligibility criteria of the REWIND trial (Figure 1) and when following the eligibility criteria of established database emulation studies to enhance generalizability to patients typically encountered in clinical practice (Figure 2).

6.3 Setting

6.3.1 Context and rationale for definition of time 0 (and other primary time anchors) for entry to the study population

Time 0 in the database study was defined to either emulate the inclusion criteria for the trial (trial), or expanded to reflect clinical routine care settings (expanded). See appendix tables 1^{trial, expanded} and 2^{trial, expanded} for operational definitions and detailed code algorithms.

6.3.2 Context and rationale for study inclusion criteria:

Study inclusion criteria were defined to either emulate the inclusion criteria for the trial (trial), or expanded to reflect clinical routine care settings (expanded). See appendix tables 1^{trial, expanded} and 2^{trial, expanded} for operational definitions and detailed code algorithms. A flowchart of the study cohort assembly is provided in Appendix 3^{trial, expanded}.

6.3.3 Context and rationale for study exclusion criteria

Study exclusion criteria were defined to either emulate the inclusion criteria for the trial (trial), or expanded to reflect clinical routine care settings (expanded). See appendix tables 1^{trial, expanded} and 2^{trial, expanded} for operational definitions and detailed code algorithms. A flowchart of the study cohort assembly is provided in Appendix 3^{trial, expanded}.

6.4 Variables

6.4.1 Context and rationale for exposure(s) of interest

The exposure and comparator were defined to emulate the agents compared for the trial, dulaglutide vs sitagliptin. See appendix tables 1^{trial, expanded} and 2^{trial, expanded} for operational definitions and detailed code algorithms.

Algorithm to define duration of exposure effect:

Assuming the effect of the medication lasts for 45 days after the days' supply, we allow a 45 days gap between the dispensation (grace period) and also add 45 days at the end of days' supply of dispensation (exposure risk window).

6.4.2 Context and rationale for outcome(s) of interest

The primary outcome for the database study was defined to emulate the primary outcome of the trial, i.e., MACE (composite of cardiovascular death, myocardial infarction, or stroke). Due to the inability to capture cause of death in our emulation, we modified the MACE outcome to capture all-cause mortality, myocardial infarction, or stroke. See appendix tables 1^{trial, expanded} and 2^{trial, expanded} for operational definitions and detailed code algorithms. Optum includes death information from the inpatient discharged dead status, social security death master file, and deaths scraped from obituaries or other sources. MarketScan includes information from the inpatient discharged dead status as well as social security death master file. Medicare includes information from the inpatient discharged dead status, NDI cause of death, and social security death master file. The positive predictive value

for the myocardial infarction outcome algorithm using ICD-9 codes was observed to be 88.4% and 94% in validation studies.^{21,22} The PPV for the ischemic stroke outcome algorithm was 95% in a validation study using ICD9 codes.²¹ The ICD9 code algorithms were mapped to ICD10 codes and reviewed by a clinician, but the performance of the mapped codes was not further validated.

Secondary outcomes of interest include:

1. Individual components of the primary endpoint, i.e., all-cause mortality, myocardial infarction, or stroke (expanded population only).
2. Composite of myocardial infarction, stroke, hospitalization for unstable angina, coronary revascularization, or hospitalization for heart failure.
3. Hospitalization for heart failure (expanded population only).
4. Hospitalization for unstable angina (expanded population only).
5. Coronary revascularization (expanded population only)

Safety outcomes of interest include:

1. Urinary tract infections (expanded population only).
2. Serious infections (expanded population only).
3. Gastrointestinal adverse events (expanded population only).

Negative control outcomes of interest include:

1. Hernia (excluding patients with recent outcome prior to the follow-up time window). This is a negative control outcome where no difference in effect is expected for dulaglutide vs sitagliptin.
2. Lumbar radiculopathy (excluding patients with recent outcome prior to the follow-up time window). This is a negative control outcome where no difference in effect is expected for dulaglutide vs sitagliptin.

6.4.3 Context and rationale for follow up

Both on-treatment (OT) and intention-to-treat (ITT) analyses will be conducted. Adherence in clinical practice databases is expected to be much worse than in the trial, therefore the OT analysis will be the primary analysis. The OT analysis targets the relative hazard of outcomes while on treatment and may more closely emulate the effect observed in highly adherent trial participants. Both OT and ITT analyses will be conducted with up to 1-year follow-up.

Table 2. Operational Definitions of Follow Up

End of exposure (specify operational details, e.g. stockpiling algorithm, grace period)	Yes	45 days grace window and 45 days risk window
Date of add to/switch from exposure (specify algorithm)	Yes	Date of augmentation or switching from an exposure to a comparator and vice versa.
Other date (specify)	Yes	Censor upon starting any other GLP1 agonists or pramlintide, nursing home admission

¹ Follow up ends at the first occurrence of any of the selected criteria that end follow up.

6.4.4 Context and rationale for covariates (confounding variables and effect modifiers, e.g. risk factors, comorbidities, comedications)

We identified a series of covariates that were likely confounders due to being strong risk factors for the primary outcome that were associated with choice of treatment. These include demographics, disease severity related variables, comorbid conditions, comedications, frailty, healthcare utilization and markers of health seeking behaviour.

6.5 Data analysis

6.5.1 Context and rationale for analysis plan

The study will use a propensity score (PS) 1:1 nearest neighbor matching with a caliper of 0.01 on the propensity score scale. The PS will be estimated as the probability of initiating dulaglutide vs sitagliptin given the baseline patient characteristics using multivariable logistic regression models. As diagnostics for PS models, the study will evaluate distributional covariate balance using standardized differences and c-statistics post-matching. The study will estimate the hazard ratio for injectable dulaglutide vs sitagliptin on MACE outcomes in the matched population using a Cox proportional hazards model. Effect estimates obtained across databases will be summarized using fixed-effects models for meta-analysis.

A. Primary research questions and objectives

Hypothesis:	Dulaglutide decreases the risk of a composite of myocardial infarction, stroke, or death in patients with T2DM with and without previous CVD when following the eligibility criteria from the REWIND trial.
Exposure contrast:	Dulaglutide vs sitagliptin.
Outcome:	Composite of myocardial infarction, stroke, or all-cause mortality.
Analytic software:	Aetion, SAS 9.4, R.4.4.0, Python 3.13.3
Model(s): (provide details or code)	Outcome model: Cox proportional hazards Follow-up time*status(0) = exposure Fixed-effects meta analysis for combining estimates across databases

Confounding adjustment method	Name method and provide relevant details, e.g. bivariate, multivariable, propensity score matching (specify matching algorithm ratio and caliper), propensity score weighting (specify weight formula, trimming, truncation), propensity score stratification (specify strata definition), other.
	1:1 Propensity score nearest-neighbor matching with a caliper of 0.01 on the propensity score scale.
Missing data methods	Name method and provide relevant details, e.g. missing indicators, complete case, last value carried forward, multiple imputation (specify model/variables), other.
	Assumption that if no relevant claims diagnoses/procedures are present, the condition is not present.
Subgroup Analyses	List all subgroups
	Age <65, Age ≥65, Male, Female, with concomitant SGLT2 inhibitor, without concomitant SGLT2 inhibitor, with concomitant insulin, without concomitant insulin, Patients with ASCVD, Patients without ASCVD, with recent CV event (within one year prior to baseline), without recent CV event.

Hypothesis:	Dulaglutide decreases the risk of a composite of myocardial infarction, stroke, or death in patients with T2DM with and without previous CVD when expanding the eligibility criteria from the REWIND trial to reflect a broader patient population typically encountered in routine care.
Exposure contrast:	Dulaglutide vs sitagliptin.
Outcome:	Composite of myocardial infarction, stroke, or all-cause mortality.

D. Additional research questions and objectives:

Hypothesis:	Dulaglutide has no effect on risk of negative control outcomes compared to sitagliptin in two populations: (1) Patients meeting the eligibility criteria of the REWIND trial and (2) a broader patient population when expanding the eligibility criteria of the REWIND trial. Negative control outcomes include (1) hernia and (2) lumbar radiculopathy.
Exposure contrast:	Dulaglutide vs sitagliptin.
Outcome:	Separate analyses were run for each negative control outcome, including (1) hernia and (2) lumbar radiculopathy.
Analytic software:	Aetion, SAS 9.4, R.4.4.0, Python 3.13.3
Model(s): (provide details or code)	Outcome model: Cox proportional hazards Follow-up time*status(0) = exposure Fixed-effects meta analysis for combining estimates across databases

Table 5. Sensitivity analyses – rationale, strengths and limitations

	What is being varied? How?	Why? (What do you expect to learn?)	Strengths of the sensitivity analysis compared to the primary	Limitations of the sensitivity analysis compared to the primary
Negative control outcomes, including hernia, lumbar radiculopathy	We evaluate negative control outcomes of hernia and lumbar radiculopathy, where no causal effect is expected from dulaglutide, or sitagliptin.	We will evaluate the potential impact of residual confounding on this outcome for which there is not expected to be a causal effect	The evaluates the robustness of the interpretation of the primary analysis by evaluating the potential magnitude of unmeasured confounding	This analysis assumes that the confounding structure is the same or similar for the negative control outcome as the outcome of interest

Effect estimation in individuals with HbA1c measurement.	The population will be restricted to individuals with a HbA1c measurement in the 120 days before cohort entry.	To assess the impact of restricting to individuals with HbA1c measurement and including HbA1c in the PS model.	Includes baseline glycemic information as captured in laboratory HbA1c measurements.	This approach highly restricts the number of eligible individuals under study and thereby the statistical power of the analysis.
As-started analyses (observational analogue to intention-to-treat) to address potential informative censoring.	To address potential informative censoring.	We will consider the first-used medication for 365 days without considering drug discontinuation or switching, mimicking an “intention-to-treat” approach.	Reflects follow-up regimen of RCT.	Persistence of drug use is shorter in clinical practice whereas adherence is typically higher in RCTs. Therefore, we expect the estimated effects will be diluted toward the null, underestimating the true treatment effect had patients remained on therapy.
2-year on-treatment analysis	We will follow the patients for up to 2 years on-treatment.	To examine potential changes in the comparative effectiveness beyond the 1-year on-treatment analysis.	Examines potential changes of effectiveness beyond the 1-year follow-up in the primary analysis.	Few patients in clinical practice remain on treatment beyond one year. Consequently, the small number of individuals still at risk during extended follow-up represents a selected subset of patients, which may introduce bias. Moreover, the sparse data in this later period mean that outcomes among a few remaining participants can have a disproportionate effect on the Kaplan–Meier estimates.

6.5.2 Comparison of Results Between Database Studies and RCTs

We will attempt to benchmark the results of the secondary analysis from the database study against the composite end point of MACE observed in the REWIND trial. Failure to replicate the RCT findings is not necessarily indicative of the inadequacy of the healthcare claims data for emulation for a range of possible reasons, nor does failure to replicate provide information about the validity of the trial result.²⁶ Assessment of concordance in results between the database study-trial pair will use the metrics previously implemented in the RCT-DUPLICATE initiative, namely statistical significance agreement, estimate agreement, and standardized difference agreement. In this project, “full” statistical significance agreement was defined by estimates and confidence intervals on the same side of null; estimate agreement was defined by whether estimates for the trial emulation fell within the 95% CI for the trial results; standardized difference agreement between treatment effect estimates from trials and emulations was defined by

standardized differences $|Z| < 1.96$ ($Z = \frac{(\theta_{RCT} - \theta_{RWE})}{\sqrt{\hat{\sigma}_{RCT}^2 + \hat{\sigma}_{RWE}^2}}$ where θ are the treatment effect estimates and the $\hat{\sigma}^2$ are associated variances). In addition, “partial” significance agreement was defined as meeting pre-specified non-inferiority criteria even though a more highly powered database study may have indicated superiority.^{26,27}

6.6 Data sources

6.6.1 Context and rationale for data sources

Reason for selection: The study will be conducted in 3 US health care claims databases: Optum Clinformatics (2014-2026), Merative MarketScan (2014-2023) and Medicare (2014-2020).

Strengths of data source(s): Each data source contains deidentified, longitudinal, date-stamped information on patient enrollment, demographics, inpatient/outpatient diagnosis and procedures, admission and discharge dates, and medication dispensation. The death data is captured in the Optum database from inpatient discharge status, social security death master file, and deaths scraped from obituaries or other sources. The death data in MarketScan is captured from the social security death master file and inpatient discharge status. . It is recognized that the social security death master file has high specificity and positive predictive value for deaths. While this data resource has under captured deaths since 2011, the capture of deaths is not expected to be differential between compared exposure groups. The death data is captured in the Medicare database from inpatient discharge status, and social security death master file.²⁸⁻³⁰

Limitations of data source(s):

Patient healthcare encounters are only observable when they are enrolled in an insurance plan that contributes to the database. Patients may change insurance plans for multiple reasons. Both Optum Clinformatics and Merative MarketScan are primarily employer based insurance databases where patients may disenroll with job changes. Patients in Medicare may move in and out of fee-for-service plans. We are excluding person-time in health maintenance organization (HMO) plans due to concerns about the completeness of capture of diagnoses and procedures. This means that we require patients to be enrolled in Medicare parts AB and D during the baseline assessment window and censor patients if they switch to part C. In claims data, dispensing data for inpatient medication is unavailable. Diagnoses reflect billing practices, therefore algorithms (preferably validated) are needed for accurate phenotyping of patient conditions. Services that are not covered by insurance do not appear in the data. The trial evaluated cardiovascular deaths, however we will evaluate all cause death in the emulation because most deaths in this cohort of patients at high cardiovascular risk will likely be attributed to cardiovascular reasons, the cause of death is not recorded for databases not linked to NDI, and the performance of NDI at identifying cardiovascular causes of death may be suboptimal.³⁰ The completeness of death ascertainment differs across the three databases. Optum captures deaths from multiple sources, including inpatient discharge status, the Social Security Death Master File, and obituary-based sources, whereas Medicare includes death information from inpatient discharge records, the Social Security Death Master File, and National Death Index linkages. In contrast, death ascertainment in MarketScan is more limited and is primarily based on inpatient discharge status, resulting in undercapture of deaths occurring outside the hospital setting. Although this limitation may reduce the sensitivity of mortality ascertainment, it is not expected to differ systematically between treatment groups and therefore is unlikely to introduce substantial differential bias in comparative effect estimates.

Data source provenance/curation: Information about Optum Clinformatics and Merative MarketScan can be found in data dictionaries and user guides that are provided to clients. Information about Medicare data provenance and curation can be found on the ResDac website.³¹

6.7 Data management

Tracking data: The Data Use Agreement (DUA) Custodian (Principal Investigator) and the Division Operations Manager (Winta Tekle) are responsible for receiving and creating a record of new data associated with the given request. The Operations Manager is responsible for all indexing and archiving

of documents and electronic media related to data that the Division receives and will log data location, data contents, and associated DUA and Institutional Review Board (IRB) numbers in the Division's centralized tracking system.

Handling and storage: In-scope data will be stored utilizing Mass General Brigham approved information systems – i.e., Division servers and Mass General Brigham network storage.

Archiving: Data retention and any removal will be executed by the Division Operations Manager (Winta Tekle) and Data Manager (Todd MacGarvey). The Division follows Mass General Brigham enterprise record retention policies and follow the terms of the agreement through which the in-scope data was received.

Information security: The Division follows Mass General Brigham's Enterprise Information Security Program (EISP). The EISP helps by providing assurance that Mass General Brigham information and information systems are protected from unauthorized access, use, disclosure, duplication, modification, or destruction in order to maintain their confidentiality, integrity, and availability. To that end, the EISP policies, standards and procedures create an information security framework that is aligned with the recommendations of the International Organization for Standardization's (ISO) publication 27001 and the National Institute of Standards and Technology's (NIST) publication 800-53 Family of Controls and MGB regulatory and legal requirements (as a HIPAA covered entity).

Mass General Brigham workforce members are required to complete new workforce privacy and information security training upon hire and annually thereafter. Refresh training is provided as appropriate. Mass General Brigham workforce members are required to review and sign a Confidentiality Agreement upon hire and annually thereafter. Additionally, we follow Enterprise Information Security and Privacy policies, including Managing Workforce Members Information Security Responsibilities Policy, which was developed to help assure that Mass General Brigham workforce members are competent and eligible to support the information security responsibilities associated with their role. Mass General Brigham workforce, including Division staff, are required to comply with Enterprise Information Security and Privacy Policies.

Facilities: The research team uses a highly secure, state-of-the-art, computing facility housed at Mass General Brigham's Corporate Data Centers in Needham and Marlborough, Massachusetts as well as Amazon Web Services (AWS). We maintain redundant storage for maximal data integrity and high-speed data access.

The Division uses Mass General Brigham corporate provisioned servers to analyze and store data in connection with this project. There are strict access controls enforced by technical means to ensure that only study staff who have been approved to conduct data analyses and contracted data engineers are able to access data (e.g., Mass General Brigham Authentication (Active Directory) utilized; auditing, logging, and monitoring enabled; firewalls enabled; etc.). All Division servers used in this study are accessible to only authorized staff only through the MGB network and utilizing VPN as appropriate (i.e., users must be on the network and logged into VPN to access). Mass General Brigham has a network information security monitoring team and in-scope servers are enrolled in enterprise security tools (e.g., vulnerability scanning service, antivirus, etc.).

The Division also uses AWS. In-scope AWS services / resources have undergone review and assessment by Mass General Brigham's Information Security Risk Assessment Team/ InfoSec Risk Management Team as required and in alignment with NIST 800-30: Guide for Conducting Risk Assessments. In-scope AWS servers are for our exclusive use (reserved instances), are covered under our organization's Business Associate Agreement with AWS. In-scope servers are housed in anonymous facilities that are not branded as AWS facilities. Physical access is strictly controlled

both at the perimeter and at building ingress points by professional security staff utilizing video surveillance, intrusion detection systems, and other electronic means.

Security attributes and controls for the Division's use of in-scope AWS in connection with this project include: encryption at rest and in transit (industry standard AES-256 encryption, SSL/TSL), anti-malware, latest OS updates and patches as well as anti-virus; multi-factor authentication (MFA), Identity and Access Management, including SSO; auditing and logging; principle of least privilege, including for traffic and ports (e.g., deny all default configurations), use of VPC enabled Step functions, etc.; separation between environments; minimum necessary (out of the box AWS roles are not used as they can be overly permissive); all data would reside in the US domestic regions – use only US east HIPAA compliant region; performance monitoring enabled and reviewed as per internal processes; passwords compliant with enterprise password policy and, as appropriate, more protective password requirements; etc. Our Division's AWS use is also subject to ongoing evaluation and monitoring as well – e.g., vulnerability scanning and management, access review, etc.

A data file list will be maintained in Amazon S3 and tracked through Cloudtrail and Cloudwatch. Reporting of data file availability for any file stored in an S3 bucket will be controlled by MGB.

Amazon EC2, Amazon EBS, and Amazon VPC are integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in Amazon EC2, Amazon EBS, and Amazon VPC. CloudTrail captures all API calls for Amazon EC2, Amazon EBS, and Amazon VPC as events, including calls from the console and from code calls to the APIs. MGB IT/security staff have full access to CloudTrail to ensure that CloudTrail monitoring is available at all times. Amazon CloudWatch Events delivers a near-real-time stream of system events that describe changes in AWS resources. Amazon CloudTrail can log, continuously monitor, and retain account activity related to actions across the MGB AWS infrastructure. CloudTrail provides event history of MGB AWS account activity. This event history simplifies security analysis, resource change tracking, and troubleshooting and complies with requirements to ensure the data file inventory is controlled by MGB.

Backups: Backups are created using industry recognized Cryptographic mechanisms (e.g., 256-bit AES encryption) as appropriate and required. Data are backed up within the MGB network from the MGB Needham data center to the MGB Marlborough data center via replication/mirroring and volume-level snapshots. AWS Backup supports both instance-level backups as Amazon Machine Images (AMIs) and volume-level backups as separate snapshots based on the resource tags. AMIs allow MGB IT and security staff to create backups of all S3 and EC2 instances. This backup approach allows elimination of EC2 instances when access to CMS data files is no longer needed. Use of temporary instances will allow highest security control to be applied regarding for whom and when CMS data files are accessible.

In addition to the safeguards listed above, the Division follows enterprise privacy and information security policies and maintains internally procedures in connection with this project to safeguard the data in connection with this project as appropriate and required including: Physical Security and Environmental Controls for Electronic Information Policy; IT Access Control Standards for Users policy; Safeguarding Fax Copiers Printers Telephone Use and Pagers; Physical Removal and Transport of Protected Health Information and Personal Information policy, etc.

6.8. Quality control

Senior Programmers and Research Specialists perform QA/QC on raw or common data model converted data via SAS/R/Aetion software. The protocol will be iteratively developed and pre-specified data checks including feasibility counts and balance on baseline covariates will be conducted with outputs reviewed by both MGB and FDA team members. Team members will review code lists to ensure fidelity to intended algorithms.

6.9. Study size and feasibility

See appendix 4^{trial, expanded} and appendix 5^{trial, expanded} (feasibility, weighting on age, sex, comorbidity score as well as all predefined propensity score variables). Propensity score distribution plots with c-statistics are available in appendix 6^{trial, expanded}. Table 1 showing prevalence of baseline characteristics and standardized differences in distribution are available in appendix 7^{trial, expanded}. Additional diagnostic evaluations, including balance assessments of laboratory and clinical examination test results not included in the propensity score as well as assessment of cardiovascular medication after follow-up, will be conducted to assess potential residual confounding and divergence of treatment over time.

7. Limitation of the methods

As we are using secondary data and the data were not collected for research, some important variables may not be collected or will be measured imperfectly. We have selected validated algorithms when possible and we have created proxies for important variables that are not directly captured in the data to reduce confounding by unmeasured factors. One measurement difference is for the primary outcome, where for the RCT, MACE was defined as stroke, myocardial infarction, and cardiovascular death, whereas in our database study, it is defined as stroke, myocardial infarction, and all cause death.

When comparing results from an RCT to a database study that emulates the design, we assume that the findings from the single RCT are internally valid.

Although we plan to emulate the important features of each RCT as closely as possible in healthcare claims, there may be some elements of RCT design that are not emulable with a database study, which means that the study generating RWE and the RCT will address slightly different clinical questions. For example, in routine clinical practice, adherence to treatment is typically not as high as it is in an RCT with strong measures in place to encourage adherence to the study protocol. The REWIND trial utilized a 3-week single-blind placebo run-in period to exclude participants with poor adherence or tolerance prior to randomization. Our emulation did not include a run-in period to mitigate potential immortal time bias. Instead, we used a new-user design that may address confounding by indication, and consequently there is more discontinuation and short-term medication use in the patients identified in claims databases than trial participants.

Apparent agreement between RCT and database study results could occur if the effects of multiple factors (chance, emulation differences, bias) cancel each other out.

8. Protection of human subjects

This study has been approved by the Brigham and Women's Hospital Institutional Review Board.

- A. Patient characteristics by treatment group
- B. Summary Parameters of Study Population
- C. Median Follow up Time in Overall Study Population
- D. Reasons for Censoring in Overall Study Population
- E. Initial Power Assessment
- F. Aetion report link
- G. Review by Principal Investigator

In order to complete the initial power analysis, a dummy outcome of a 90-day gap in database enrollment was used. This outcome is used to ensure that no information on the comparative risks of the outcomes of interest are available at this stage. We completed a PS overlap weighted comparative analysis using this outcome. The PS included only 3 covariates: age, sex, and combined comorbidity index. Power calculations are based on the formulas from Chow et al. (2008).

In order to complete the feasibility analysis, a dummy outcome of a 90-day gap in database enrollment was used. This outcome is used to ensure that no information on the comparative risks of the outcomes of interest are available at this stage. We completed a PS overlap weighted comparative analysis using this outcome. The PS included all prespecified covariates listed in the protocol. Power calculations are based on the formulas from Chow et al. (2008).

In order to complete the initial power analysis, a dummy outcome of a 90-day gap in database enrollment was used. This outcome is used to ensure that no information on the comparative risks of the outcomes of interest are available at this stage. We completed a PS overlap weighted comparative analysis using this outcome. The PS included only 3 covariates: age, sex, and combined comorbidity index. Power calculations are based on the formulas from Chow et al. (2008).
