## 2 INTRODUCTION

Study 306 is an open-label, two-arm (Active vs Diet-only Control), randomized control study to evaluate safety and efficacy of pegvaliase and characterize the PK of pegvaliase in adolescent subjects with phenylketonuria (PKU).

The purpose of this Statistical Analysis Plan (SAP) is to provide a comprehensive description of methods of the data analyses outlined in the protocol (22 September 2021).

If discrepancies exist between the text of the statistical analysis as planned in the protocol and the final SAP, the SAP will prevail.

### 2.1 Objectives of Study

The primary objective of the study is:

- To evaluate the efficacy of pegvaliase in adolescent subjects with PKU
- To evaluate the safety of pegvaliase in adolescent subjects with PKU

The secondary objectives of the study are:

- To characterize total dietary protein intake in adolescent subjects with PKU after pegvaliase treatment
- To characterize the pharmacokinetics (PK) of pegvaliase in adolescent subjects with PKU

The exploratory objectives of the study are:

- To evaluate the effect of pegvaliase treatment on neurocognitive outcomes in adolescent subjects with PKU
- Explore the biochemical, molecular, and cellular aspects of PKU
- PAH genotyping

### 2.2 Study Design

This is an open-label, two arm, randomized control study. Approximately 54 subjects 12-17 years old, inclusive, with diet-only control will be enrolled. At enrollment, subjects will be randomized 2:1 to the active (pegvaliase) and control (diet-only) treatment arms, with 36 subjects receiving daily pegvaliase and 18 subjects managing PKU by diet alone.

Treatment assignment will be stratified by blood Phe  $\leq 1000$   $\mu\text{mol/L}$  or  $> 1000$   $\mu\text{mol/L}$  based on an average of the 2 Screening blood Phe assessments. Subjects in the active and control arms will follow the same visit schedules and perform the same assessments throughout the 72-week Primary Treatment Phase (Part 1) except that the control subjects will not be receiving pegvaliase so will not have PK draws or immunogenicity assessments.

After providing informed consent, subjects will enter the Screening/Run-in period, which will last 4 weeks and include 2 assessments of blood Phe levels, 7 to 10 days apart, to determine eligibility. Following confirmation that the 2 blood Phe results are  $> 600 \mu\text{mol/L}$  and all other eligibility criteria have been met, subjects may be enrolled in the study on Day 1. During the Screening/Run-in and the Primary Treatment Phase (Part 1), subjects will be required to maintain stable protein intake from both medical food and/or intact food.

The duration of Part 1 is 72 weeks, during which pegvaliase treatment will be initiated for subjects in the active arm using an Induction/Titration/Maintenance (I/T/M) dosing regimen. The I/T/M dosing regimen consists of an Induction/Titration Phase (9 weeks) and a Maintenance Phase. Required clinic visits during Part 1 will occur weekly for the first 8 weeks, every 4 weeks thereafter, and when the pegvaliase dose is escalated to 40 mg/day or 60 mg/day. The assessments performed at the clinic visits include measurement of blood Phe, neurocognitive assessments, PK blood draws (active subjects only), and safety assessments.

Beginning Week 73, subjects in the active treatment arm will continue to receive pegvaliase in the Extension Phase (Part 2) for up to 80 additional weeks (through Week 153). Beginning Week 73 the subjects in the control treatment arm will initiate pegvaliase treatment and follow a parallel schedule for dosing, study visits, and assessments in Weeks 73 through 145 to that followed by the active arm subjects during the Primary Treatment Phase (Part 1) from Weeks 1 through 73, after which they will receive pegvaliase for up to 8 additional weeks (through Week 153).

### **2.3 Study Population**

Individuals with PKU aged 12 to 17 years old, inclusive, and diet-only control at the start of the Screening/Run-in Period (Day -28) are candidates for participation in the study.

Additional criteria for study participation are presented in Protocol 165-306 Section 5.1 and Section 5.2.

### **2.4 Study Dosage and Administration**

Subjects will receive pegvaliase at a concentration of 5.0 or 20.0 mg/mL. Pegvaliase will be administered subcutaneously at dose levels in the range of 2.5 to 60 mg. The minimum dose of pegvaliase is 2.5 mg/week. The maximum allowable daily dose of pegvaliase is 60 mg/day (for a maximum weekly total dose of 420 mg).

### **2.5 Sample Size Determination**

Approximately 54 subjects will be enrolled into the study and randomized to the pegvaliase or diet-only treatment in 2:1 ratio. Assuming a mean (SD) reduction in Phe at Week 73 of

640 (570)  $\mu\text{mol/L}$  in the pegvaliase group and 100 (250)  $\mu\text{mol/L}$  in the diet-only group, a total sample size of 54 subjects will provide more than 90% power to detect a treatment difference, based on the two-sample T-test with unequal variance and a significance level of 0.05 (two sided).

Approximately 72 subjects will be screened for study participation such that approximately 54 subjects will be enrolled in the study.

For the pegvaliase treatment arm, the mean (SD) assumption of reduction in blood Phe is based on subjects 16 to 24 years of age who completed 17 months of treatment in previous pegvaliase studies utilizing an I/T/M dosing regimen ( $n = 46$ ). For the diet-only arm, the mean (SD) assumption of reduction in blood Phe is based on BioMarin's PKUDOS (Phenylketonuria Demographic, Outcomes, and Safety) registry for patients aged 12 to <18 years old on diet only control with baseline Phe > 600  $\mu\text{mol/L}$  at year 1 of study enrollment ( $n = 57$ ).

## **2.6 Blinding and Randomization Methods**

### **2.6.1 Blinding Method**

Subjects will receive open-label pegvaliase or diet-only treatment.

### **2.6.2 Randomization Method**

Subjects will be randomized in a 2:1 ratio to the active (pegvaliase) or control (diet-only) treatment arm, respectively. Treatment assignment will be stratified by blood Phe  $\leq 1000 \mu\text{mol/L}$  or  $> 1000 \mu\text{mol/L}$  based on an average of the 2 Screening blood Phe assessments.

## **2.7 Interim Analysis**

There are no interim analyses planned. The primary analysis will be performed after subjects completed Part 1 or discontinued from the study. The final analysis will be performed after subjects have completed the study or discontinued from the study.

### 3 GENERAL ANALYSIS CONSIDERATION

Descriptive summaries of continuous variables will include the mean, standard deviation (SD), median, minimum, and maximum. Descriptive summaries of categorical variables will include n, frequency, and percentage.

#### 3.1 Analysis Populations

The All Enrolled population will consist of all subjects (or their parent/guardians, if applicable) who agree to participate in the clinical study following completion of the informed consent process and determination of study eligibility.

The Intent to Treat (ITT) population will consist of all subjects who are randomized. Subjects will be analyzed according to the randomized treatment.

The Safety population will consist of all subjects who received study treatment (pegvaliase or diet-only management of PKU). Subjects will be analyzed according to the treatment actually received during Part 1.

The Per Protocol (PP) population will consist of all subjects in the ITT population who are compliant with the protocol with no major protocol deviations impacting the efficacy analysis. The PP population will be determined by the study team through data review before database lock for primary analysis; reasons for excluding subjects will be defined and documented prior to database lock for primary analysis.

The PK population will consist of all subjects with at least one PK measurement.

#### 3.2 Treatment Group Presentation

The following treatment groups will be used in summary tables:

Part 1: pegvaliase (active) or diet-only (control)

Part 2: pegvaliase (subjects continuing on pegvaliase) or diet-only (subjects transitioning from control to pegvaliase)

#### 3.3 Pooling of Data from Sites with Small Enrollment

Since the enrollment for each site is expected to be small, the analyses will not be adjusted by site or pooled sites.

#### 3.4 Study Day Derivation

Study days will be derived as follows:

Pegvaliase arm: the first dose date will be assigned as Study Day 1

Diet only arm: the Visit 1 date will be assigned as Study Day 1

For visit occurs on or after Study Day 1, Study Day = visit date – day 1 date + 1

For visit occurs before Study Day 1, Study Day = visit date – day 1 date. There is no Study Day 0.

### 3.4.1 Baseline Definition

The baseline for all safety and efficacy endpoints (when applicable) is defined as the last non-missing measurement collected prior to the first pegvaliase dose (pegvaliase arm) or prior to or on Visit 1 date (diet-only arm), unless otherwise specified.

Baseline blood Phe concentration is defined as the average of 3 pre-treatment measurements collected between screening/Run-in and Day 1 pre-dose.

Baseline total protein intake is defined as the mean total dietary protein intake calculated from the 3 separate 3-day diet diaries collected during Screening/Run-in.

### 3.5 Visit Window for Analysis

All efficacy and safety data will be summarized by study week of assessment. An assessment for a subject will be classified according to the study day of the assessment where it falls within a window. The windows are designated for each scheduled week of visit and centered on a target day. If there are two or more assessments within a designated window, the assessment that is closest to the target day will be used for analyses. If the two closest assessments to the target day are equidistant from the target day, then for numerical variable, the average of the two assessments will be used for analyses. For categorical variables, the worst of the 2 equidistant measurements, indicating less treatment effect, will be used.

[Table 3.5.1](#) ~~Table 3.5.1~~ lists the scheduled weeks of the assessments collected in this study and the corresponding range of treatment days (window) during which a visit may have occurred.

Formatted

**Table 3.5.1: Visit Time Windows for the Treatment Period**

| Pegvaliase | Derived Visit                              | Target Day <sup>a</sup> | Window <sup>b</sup>                                |
|------------|--------------------------------------------|-------------------------|----------------------------------------------------|
|            | Screening/Day 1                            | Day 1                   | ≤ Day 1                                            |
|            | Week 2                                     | Day 8                   | Day 2 to Day 11                                    |
|            | Week XX ( $3 \leq XX \leq 8$ , every week) | Day $(XX - 1) * 7 + 1$  | Day $(XX - 1) * 7 - 2$ to Day $(XX - 1) * 7 + 4$   |
|            | Week 9                                     | Day 57                  | Day 54 to Day 70                                   |
|            | Week XX ( $XX \geq 13$ , every four weeks) | Day $(XX - 1) * 7 + 1$  | Day $(XX - 1) * 7 - 13$ to Day $(XX - 1) * 7 + 14$ |

|           | Week 9                                             | Day 57                          | Day 54 to Day 70                                                         |
|           | Week XX ( $13 \leq XX \leq 69$ , every four weeks) | Day $(XX - 1) * 7 + 1$          | Day $(XX - 1) * 7 - 13$ to Day $(XX - 1) * 7 + 14$                       |
|           | Week 73                                            | Day 505                         | Day 491 to Day 508                                                       |
| Part 2    | Week 73                                            | Day of first dose of pegvaliase | Day of first dose of pegvaliase                                          |
|           | Week 74                                            | Week 73 day + 7                 | Week 73 day + 1 to Week 73 day + 10                                      |
|           | Week XX ( $75 \leq XX \leq 80$ , every week)       | Week 73 day + $(XX - 73) * 7$   | Week 73 day + $(XX - 73) * 7 - 3$ to Week 73 day + $(XX - 73) * 7 + 3$   |
|           | Week 81                                            | Week 73 day + $(81 - 73) * 7$   | Week 73 day + $(81 - 73) * 7 - 3$ to Week 73 day + $(81 - 73) * 7 + 13$  |
|           | Week XX ( $XX > 81$ , every four weeks)            | Week 73 day + $(XX - 73) * 7$   | Week 73 day + $(XX - 73) * 7 - 14$ to Week 73 day + $(XX - 73) * 7 + 13$ |

<sup>a</sup> Target days are relative to the Study Day 1.

<sup>b</sup> Visit day is calculated by (visit date – Study Day 1 + 1).

Diet only group: all Part 2 visit is relative to the first dose day of pegvaliase

### 3.6 Handling of Dropouts and Missing Data

Subjects who discontinued prematurely will not be replaced.

Missing dates or partially missing dates will be imputed conservatively for concomitant medications and AEs to ensure that an AE is considered treatment emergent and has the longest possible duration. Missing data in blood Phe will be handled by multiple imputation method, more details are provided in Section [12.1.1](#)

#### **4 SUBJECT DISPOSITION**

The total number of enrolled subjects, the number (%) of subjects who received study treatment, the number (%) of subjects completed Part 1, the number (%) of subjects who completed the study, and the number of subjects in each analysis population (ITT, Safety, PP and PK), as appropriate, will be summarized.

#### **5 DISCONTINUATION AND COMPLETION**

For subjects who prematurely discontinued the study, the primary reason for discontinuation will be summarized by treatment group. A similar summary will be provided for subjects who discontinued study treatment. A subject listing of completion and early termination from study will also be provided.

#### **6 PROTOCOL DEVIATIONS**

Both major and minor protocol deviations will also be summarized by deviation category. All protocol deviations will be listed. Subjects with inclusion or exclusion criteria deviations will also be provided in a separate listing.

#### **7 DEMOGRAPHICS AND BASELINE CHARACTERISTICS**

Subject demographic and baseline characteristics will be summarized for the ITT population. Demographics include age, age category (12 to 15 / 16 to 17 years old), gender, race, country and ethnicity. Baseline characteristics include height, weight, BMI, blood Phe concentration, neurocognitive assessment, three-day average dietary intake, restricted diet, genotyping and antibody status.

#### **8 MEDICAL HISTORY**

Each subject's chronic diseases, disorders, and surgeries in the past will be collected as general medical history. General medical history will be summarized by System Organ Class (SOC) and Preferred Term (PT) by descending order of frequency. A by-subject listing of each subject's medical history will also be provided.

## 9 PRIOR AND CONCOMITANT MEDICATIONS/PROCEDURES

The following definitions will be used to determine prior and concomitant medications:

- Prior medications: any medications taken prior to first dose administration of pegvaliase (pegvaliase arm) or study day 1 (diet-only arm).
- Concomitant medications: any medications initially taken on or after first dose administration of pegvaliase (pegvaliase arm) or study day 1 (diet-only arm).
- Prior and concomitant medications: any medications taken both prior to and on or after first dose administration of pegvaliase (pegvaliase arm) or study day 1 (diet-only arm) will be reported both as prior and concomitant medications. Therefore, any medications taken prior to first dose administration of pegvaliase (pegvaliase arm) or study day 1 (diet-only arm) where the stop date is reported as “continuing” or missing will be considered as both prior and concomitant medications.

In the event the start date of a medication is partial, the following imputation rules will be applied:

If only day is missing, then the start date will be imputed as the first day of the month, if the year and month is same or after the first dose year and month. If only day is missing, then the start date will be imputed as the last day of the month, if the year and month is prior to the first dose year and month. If month is the same as the month of study day 1 then the start date will be imputed as the date of study day 1.

- If only year is non-missing, then the start date will be imputed as the first day of the year. If year is the same as the year of study day 1 then the start date will be imputed as the date of study day 1.

In the event the stop date of a medication is partial, the following imputation rules will be applied:

- If only day is missing, then the end date will be imputed as the last day of the month.
- If only year is non-missing, then the end date will be imputed as the last day of the year.

All medications will be coded using the current version of the World Health Organization Drug (WHO Drug) dictionary (MMM YYYY). Prior and concomitant medication use will be separately summarized by Anatomical Therapeutic Chemical (ATC) medication class (Level 4) and preferred name (ie, generic medication name). A subject reporting the same medication use more than once will be counted once when calculating the number and percentage of subjects who received that medication. A subject listing of each subject’s prior and concomitant medications will be provided.

## 10 STUDY DRUG USAGE

Study drug usage rate will be calculated based on the drug exposure records captured in eCRFs and dispensed drug amount captured in the Interactive web response system (IWRS).

The overall study drug usage rate will be derived from the total amount of study drug intake divided by the total dispensed study drug amount over the study period and multiplied by 100%. The rate will be calculated for Part 1, Part 2 and overall study period.

## 11 EXTENT OF EXPOSURE TO STUDY TREATMENT

For pegvaliase treatment period, the total number of days on study treatment, total amount of study drug (mg) taken and average daily dose (mg) will be summarized for Part 1, Part 2 and overall study period. Any dose interruption longer than 28 days will be excluded from the total exposure duration calculation.

In addition, the total number of days on diet control treatment will be summarized for pegvaliase and diet-only arm, the summary of protein intake is described in Section [12.2.1](#)

A by-subject listing of each subject's extent of exposure and compliance will be provided.

## 12 EFFICACY EVALUATIONS

Unless otherwise specified, efficacy analysis will be based on the ITT population.

### 12.1 Primary Efficacy Endpoint

The primary efficacy endpoint is the change from baseline in blood Phe following 72 weeks on study, which is defined as the average of Week 69 and Week 73 blood Phe measurements – baseline blood Phe. Change from baseline in blood Phe will be compared between subjects in the pegvaliase arm and the diet-only arm.

#### 12.1.1 Primary Estimand

Population: the target study population comprises adolescent subjects (ages 12-17) with PKU who meet the inclusion and exclusion criteria as specified in the protocol. The analysis population is the ITT population as defined in Section 3.1

Variable: the variable is the primary efficacy endpoint, change from baseline in blood Phe following 72 weeks on study, as defined in Section 12.1.

Handling of missing data and intercurrent events (ICEs): the treatment policy will be adopted which will include all blood Phe data regardless of intercurrent events such as treatment discontinuation. Missing blood Phe data will be imputed by multiple imputation methods as described in Section 12.1.2.

Population level summary: the difference in change from baseline in blood Phe following 72 weeks on study will be estimated by an Analysis of Covariance (ANCOVA) model with multiple imputation of missing data, as described in Section 12.1.2.

#### 12.1.2 Primary Analysis

The primary efficacy endpoint will be evaluated using an ANCOVA model, which will include baseline blood Phe as covariates and treatment group as factor, with missing data handled by multiple imputation. The imputation will be performed using the SAS procedure PROC MI; the variable list for imputation will include all baseline and post-baseline blood Phe measurements and stratified by treatment. The MCMC method will be used to generate 100 imputation datasets. The least square (LS) mean and 95% confidence interval will be calculated for the treatment difference between pegvaliase and diet-only arms following 72 weeks on study. The primary analysis will be based on the ITT population.

Descriptive summary of observed values, change and percent change from baseline in blood Phe will be provided by visit and treatment. In addition, categorical summary will be performed for the following categories:

Proprietary and Confidential

Percent of subjects with blood Phe  $\leq$  120  $\mu\text{mol/L}$  at each visit during study

Percent of subjects with blood Phe  $\leq$  360  $\mu\text{mol/L}$  at each visit during study

Percent of subjects with blood Phe  $\leq$  600  $\mu\text{mol/L}$  at each visit during study

In Part 2, change and percent change in blood Phe from average of Week 69 and Week 73 visits will also be summarized for subjects transitioning from control to pegvaliase.

### 12.1.3 Sensitivity Analysis

The same statistical model used in the primary analysis will be repeated in the PP population.

## 12.2 Secondary Endpoints

The secondary endpoints are as follows:

Change from baseline in total dietary protein intake (i.e., medical food and/or intact food).

The total dietary protein intake following 72 weeks on study is defined as the mean total dietary protein intake calculated from the diet diaries collected at the Week 69 and Week 73 visits.

Plasma sample for trough PK

### 12.2.1 Analysis on Secondary Endpoints

For the change from baseline in total dietary protein intake, the observed values, change and percent change from baseline at each visit will be summarized. Similar summary will also be provided for protein intake from medical food and from intact food separately. The values collected on the three-day diet diary will be averaged for each parameter at each visit before being summarized.

In Part 2, change and percent change in dietary protein intake from average of Week 69 and Week 73 visits will also be summarized for subjects transitioning from control to pegvaliase.

For plasma sample of trough PK, table summary and subject listing of observed value will be provided at each visit. Details of PK analysis of pegvaliase concentration data will be provided in a separate Clinical Pharmacology analysis plan.

## 12.3 Exploratory Endpoints

The exploratory endpoints are as follows:

The ADHD Rating Scale IV inattention subscale (ADHD-RS IV) rated by the parent/guardian and performed at Baseline (Day 1, pre-dose) and every 12 weeks throughout the study

The Behavior Rating Inventory of Executive Function (BRIEF) rated by the parent/guardian and performed at Baseline (Day 1, pre-dose) and every 12 weeks throughout the study

### **12.3.1 Analysis on Exploratory Endpoints**

Observed values and change from baseline for both ADHD-RS IV score and BRIEF score will be summarized at each visit. In Part 2, change in both scores from Week 73 visit will also be summarized for subjects transitioning from control to pegvaliase.

## 13 SAFETY EVALUATIONS

Safety will be assessed by examining the incidence, exposure adjusted event rate, severity grade, and relationship to study drug of all treatment-emergent adverse events (TEAEs) reported during the study period. In addition, clinical laboratory results, vital signs, pregnancy test, physical exam and ECG values will be assessed. In general, safety assessments will be summarized by treatment received in Part 1 (pegvaliase and diet-only) and in Part 1 and 2 (pegvaliase and diet-only).

### 13.1 Adverse Events

AEs will be coded in accordance with the MedDRA (version xx). Only treatment-emergent adverse events (TEAEs) occurring and reported during the study period will be included in adverse event summaries. A TEAE is defined as any AE that newly appeared or worsened in severity after first dose of pegvaliase (pegvaliase arm) or on or after study day 1 (diet-only arm) until 30 days after last dose of the study. If the onset date of an AE is missing, the AE will be considered treatment-emergent.

In Part 2 subjects transitioning from control to pegvaliase, a TEAE occurred during pegvaliase treatment period is defined as any AE that appeared or worsened in severity after first dose of pegvaliase until 30 days after last dose.

#### 13.1.1 All Adverse Events

The incidence and frequency of all treatment-emergent AEs will be summarized by system organ class (SOC), preferred term (PT), relationship to study drug and National Cancer Institute (NCI) Common Terminology Criteria for Adverse Events (CTCAE) severity grades. For AEs that occurred more than once during the study, the maximum severity will be used to summarize the AEs by severity.

If the onset date or end date of an adverse event is partial, the same imputation rules described in Section 9 will be applied.

The following summary will be performed for treatment-emergent AEs:

- All AEs by SOC and PT
- All AEs by SOC, PT and severity
- AEs assessed by investigators as related to study drug by SOC and PT
- AEs assessed by investigators as related to study drug by SOC, PT and severity
- Serious AEs (SAEs) by SOC and PT

- All AEs by PT in descending frequency order
- All AEs by SOC and PT with exposure adjusted event rate
- AEs leading to withdrawal from study by SOC and PT
- AEs leading to study drug discontinuation by SOC and PT

In addition, summary tables and listings will be provided for AEs of special interest:

- Acute systemic hypersensitivity reaction (refer to [Appendix 1](#)~~Appendix 1~~)
- Anaphylaxis per FDA criteria (refer to [Appendix 1](#)~~Appendix 1~~)
- Angioedema
- Serum sickness
- Severe injection site reaction defined as an injection site reaction that is considered CTCAE Grade  $\geq 3$
- Hypophenylalaninemia events (defined as blood Phe  $< 30 \mu\text{mol/L}$  on 2 consecutive measurements)
- Arthralgia that is either persistent (AE duration  $> 6$  months), severe (CTCAE Grade  $\geq 3$ ), or that requires treatment with a steroid (excluding topical)

### 13.2 Clinical Laboratory Tests

Descriptive statistics will be presented for clinical laboratory tests at each scheduled visit and for change in laboratory values from baseline. The proportion of subjects who experienced at least one laboratory test result outside the normal ranges will be presented for each measurement as appropriate. Shift table from baseline to most extreme post-baseline value based on normal range and based on CTC grading (where available) will also be generated for each parameter as appropriate. A subject listing of laboratory test results for hematology, chemistry, urinalysis, and other laboratory tests will be provided separately. Values with CTC grade as 3 or above will be flagged in the listings.

A listing of laboratory test results for subjects with alanine transaminase (ALT) or alanine aminotransferase (AST)  $\geq 3\text{xULN}$  and total bilirubin  $\geq 2\text{xULN}$  will also be provided.

### 13.3 Vital Signs

Vital signs will include systolic blood pressure (SBP) and diastolic blood pressure (DBP) measured in millimeters of mercury (mm Hg), heart rate in beats per minute, respiration rate in breaths per minute, and temperature in degrees Celsius ( $^{\circ}\text{C}$ ).

Summary statistics including n, mean, SD, median, minimum, and maximum will be provided for these parameters at each visit. A subject listing will also be provided.

Proprietary and Confidential

### 13.4 12-lead Electrocardiogram

The frequency of abnormalities and clinically significant abnormalities in 12-lead electrocardiogram will be summarized at each visit. A subject listing of ECG findings will be provided.

### 13.5 Physical Examination

Physical examinations will include assessments of general appearance; head, eyes, ears, nose, and throat; the cardiovascular, dermatologic, lymphatic, respiratory, gastrointestinal, musculoskeletal, and neurologic systems. Other body systems may be examined if needed. A subject listing for clinically significant findings at each visit will be provided.

### 13.6 Immunogenicity Tests

Immunogenicity will be performed using validated immunogenicity assays. Immunogenicity assays include total anti-pegvaliase antibodies (TAb), anti-PAL IgG, anti-PAL IgM, anti-PEG IgM, anti-PEG IgG, and neutralizing antibodies (NAb). In the event of a Hypersensitivity Reaction visit (HRV), anti-pegvaliase IgE will be assessed.

For immunogenicity analysis, incidence tables and titer summary statistics including mean, median, standard deviation, and minimum/maximum titer values at each study visit will be provided for each antibody analyte.

Anti-drug antibody impact on safety will be evaluated. Plots and tables will be generated to explore the potential impact of anti-drug antibodies on HAE frequency and severity. A listing will be provided for each subject who has Hypersensitivity Reaction Visit.

Anti-drug antibody impact on efficacy will be evaluated. Plots and tables may be generated to explore the potential impact of anti-drug antibodies on blood Phe levels.

### 13.7 Pregnancy Test

A subject listing for pregnancy urine sample test at each visit will be provided.

## 14 APPENDICES

### **Appendix 1: Search Strategies for Adverse Event of Special Interest, and Sponsor Defined AEs of Clinical Significance**

MedDRA version: most current version at program termination

#### **1. Acute systemic hypersensitivity reaction**

An anaphylaxis episode which meets the NIAID/FAAN criteria and is positively adjudicated by an independent expert allergist/immunologist as anaphylaxis according to the NIAID/FAAN criteria and based on clinical judgment of the significance of symptoms, is referred to as an acute systemic hypersensitivity reaction.

#### **2. Anaphylaxis per FDA criteria**

Anaphylaxis events defined according to the DPARP methodology are referred to as “anaphylaxis per FDA criteria”. The FDA’s assessment methodology includes individual case safety reports with any of the following characteristics:

Clinical manifestations consistent with NIAID/FAAN Criterion 1 (skin involvement + respiratory or cardiovascular compromise); and

Verbatim reports of anaphylaxis or anaphylactic reaction, even if NIAID/FAAN criteria were not met; and

Cases involving subject injection of epinephrine alone, even if subject did not experience signs/symptoms necessary to meet NIAID/FAAN criteria.

Anaphylaxis episodes meeting these FDA criteria are the primary focus of the safety assessment.

### 3. Angioedema per sponsor criteria

A 2-step process to identify angioedema per sponsor criteria, the following assessment was performed on the entire AE dataset:

- Step 1: all reported ADRs suggestive of angioedema using the Angioedema MedDRA HLT search, which includes the following 21 PTs: angioedema, circumoral oedema, eyelid oedema, face oedema, Gleich's syndrome, hereditary angioedema, idiopathic angioedema, intestinal angioedema, laryngeal oedema, laryngotracheal oedema, lip oedema, lip swelling, mouth swelling, oculorespiratory syndrome, oedema mouth, oropharyngeal swelling, periorbital oedema, pharyngeal oedema, swelling face, swollen tongue, and tongue oedema.
- Step 2: BioMarin then clinically assessed the retrieved data identified from Step 1 to assign concurrent events into episodes and to exclude:
  - False positive ADR reports that have clear confounders which impact assessment, eg, onset of event(s)  $\geq 30$  days after last dose or events/episodes with a very clear alternative etiology, such as throat swelling secondary to intubation). Cases were not excluded where the events have a long duration which may be atypical for angioedema, or where events occurred concurrent with other conditions which may have contributed to their development (eg, eye swelling reported during episode(s) of seasonal allergy).
- Episodes which occurred as part of an acute systemic hypersensitivity reaction and, therefore, will already be included in the incidence for acute systemic hypersensitivity reactions (to avoid duplication).

In the sponsor's opinion, the methodology described above is more likely to be reflective of the true incidence of angioedema manifestations.

### 4. Serum Sickness

Serum sickness-like reaction will be defined by including all preferred term of serum sickness, serum sickness-like reactions and Type III immune complex mediated reactions.

### 5. Severe Injection-site reaction

Severe injection site reaction will be identified as any injection site reaction report that is reported as Common Terminology Criteria for Adverse Events (CTCAE) Grade 3 or above in severity and meeting MedDRA high level term (HLT) for Injection site reaction, or is reported as a Serious Adverse Reaction, irrespective of severity.

**6. Hypophenylalanemia**

Hypophenylalaninemia is defined as a blood phenylalanine (Phe) level  $\leq 30$   $\mu\text{mol/L}$  for a minimum of 2 consecutive values, with the start of the event defined as the first blood Phe assessment day with  $< 30$   $\mu\text{mol/L}$  and the end of the event defined as the day prior to the first blood Phe assessment  $\geq 30$   $\mu\text{mol/L}$ .

**7. Persistent arthralgia (> 6 months)**

Arthralgia will be identified as the preferred terms of arthralgia, pain in extremity, back pain, musculoskeletal pain, and neck pain. To be included in the results, the duration of the event should be  $> 6$  months (Multiple AE records with same reported term and  $\leq 1$  day difference between the start date and end date are considered as same event).

### 3 INTRODUCTION

Study 306 is an open-label, two-arm (Active vs Diet-only Control), randomized control study to evaluate safety and efficacy of pegvaliase and characterize the PK of pegvaliase in adolescent subjects with phenylketonuria (PKU).

The purpose of this Statistical Analysis Plan (SAP) is to provide a comprehensive description of methods of the data analyses outlined in the protocol (amendment 1 dated 26 January 2022).

If discrepancies exist between the text of the statistical analysis as planned in the protocol and the final SAP, the SAP will prevail.

#### 3.1 Objectives of Study

The primary objective of the study is:

- To evaluate the efficacy of pegvaliase in adolescent subjects with PKU
- To evaluate the safety of pegvaliase in adolescent subjects with PKU

The secondary objectives of the study are:

- To characterize total dietary protein intake in adolescent subjects with PKU after pegvaliase treatment
- To characterize the pharmacokinetics (PK) of pegvaliase in adolescent subjects with PKU

The exploratory objectives of the study are:

- To evaluate the effect of pegvaliase treatment on neurocognitive outcomes in adolescent subjects with PKU
- To compare subjects' optimal maintenance pegvaliase dose across different age groups within the study
- Explore the biochemical, molecular, and cellular aspects of PKU
- PAH genotyping

#### 3.2 Study Design

This is an open-label, two arm, randomized control study. Approximately 54 US and EU subjects (ages 12 to 17 years old (US), inclusive, and 12 to 15 years old (EU), inclusive) with diet-only control will be enrolled. At enrollment, subjects will be randomized 2:1 to the active (pegvaliase) and control (diet-only) treatment arms, with 36 subjects receiving daily pegvaliase and 18 subjects managing PKU by diet alone. Treatment assignment will be stratified by Screening/Run-in blood Phe (mean of the 2 pre-treatment blood Phe assessments performed during the Screening/Run-in period) of  $\leq 1000 \mu\text{mol/L}$  or  $> 1000 \mu\text{mol/L}$ .

Subjects in the active and control arms will follow the same visit schedules and perform the

same assessments throughout the 72-week Primary Treatment Phase (Part 1) except that the control subjects will not be receiving pegvaliase so will not have PK draws or immunogenicity assessments.

After providing informed consent, subjects will enter the Screening/Run-in period, which will last 4 weeks and include 2 assessments of blood Phe levels, 7 to 10 days apart, to determine eligibility. Following confirmation that the 2 blood Phe results are  $> 600 \mu\text{mol/L}$  and all other eligibility criteria have been met, subjects may be enrolled in the study on Day 1. During the Screening/Run-in and the Primary Treatment Phase (Part 1), subjects will be required to maintain stable protein intake from both medical food and/or intact food.

The duration of Part 1 is 72 weeks, during which pegvaliase treatment will be initiated for subjects in the active arm using an Induction/Titration/Maintenance (I/T/M) dosing regimen. The I/T/M dosing regimen consists of an Induction/Titration Dosing (9 weeks) and a Maintenance Dosing. Required hospital setting visits during Part 1 will occur for all dosing visits for the first 8 weeks, every 4 weeks thereafter, and when the pegvaliase dose is escalated to 20, 40 or 60 mg/day. The assessments performed at the clinic visits include measurement of blood Phe, neurocognitive assessments, PK blood draws (subjects on pegvaliase treatment only), and safety assessments.

Beginning Week 73, subjects in the active treatment arm will continue to receive pegvaliase in the Extension Phase (Part 2) for up to 80 additional weeks (through Week 153). Beginning Week 73, subjects in the control treatment arm will initiate pegvaliase treatment and follow a parallel schedule for dosing, study visits, and assessments in Weeks 73 through 145 to that followed by the active arm subjects during the Primary Treatment Phase (Part 1) from Weeks 1 through 73, after which they will receive pegvaliase for up to 8 additional weeks (through Week 153).

### **3.3 Study Population**

Individuals with PKU aged 12 to 17 years old (US), inclusive, and 12 to 15 years old (EU), inclusive with diet-only control at the start of the Screening/Run-in Period (Day -28) are candidates for participation in the study. Additional criteria for study participation are presented in Protocol 165-306 Section 5.1 and Section 5.2.

### **3.4 Study Dosage and Administration**

Subjects will receive pegvaliase at a concentration of 5.0 or 20.0 mg/mL. Pegvaliase will be administered subcutaneously at dose levels in the range of 2.5 to 60 mg. The minimum dose of pegvaliase is 2.5 mg/week. The maximum allowable daily dose of pegvaliase is 60 mg/day (for a maximum weekly total dose of 420 mg).

### 3.5 Sample Size Determination

Approximately 54 subjects will be enrolled and randomized to the pegvaliase or diet-only groups in 2:1 ratio. Assuming a mean (SD) reduction in Phe following 72 weeks on study is 640 (570)  $\mu\text{mol/L}$  in the pegvaliase group and 100 (250)  $\mu\text{mol/L}$  in the diet-only group, a total sample size of 54 subjects will provide more than 90% power to detect a treatment difference, based on the two-sample T-test with unequal variance and a significance level of 0.05 (two sided).

Approximately 72 subjects will be screened for study participation such that approximately 54 subjects will be enrolled in the study.

For the pegvaliase treatment arm, the mean (SD) assumption of reduction in blood Phe is based on subjects 16 to 24 years of age who completed 17 months of treatment in previous pegvaliase studies utilizing an I/T/M dosing regimen ( $n = 46$ ). For the diet-only arm, the mean (SD) assumption of reduction in blood Phe is based on BioMarin's PKUDOS (Phenylketonuria Demographic, Outcomes, and Safety) registry for patients aged 12 to <18 years old on diet only control with baseline Phe > 600  $\mu\text{mol/L}$  at year 1 of study enrollment ( $n = 57$ ).

### 3.6 Blinding and Randomization Methods

#### 3.6.1 Blinding Method

Subjects will receive open-label pegvaliase or diet-only treatment.

#### 3.6.2 Randomization Method

Subjects will be randomized in a 2:1 ratio to the active (pegvaliase) or control (diet-only) treatment arm, respectively. Treatment assignment will be stratified by Screening/Run-In blood Phe (mean of the 2 pre-treatment blood Phe assessments performed during the Screening/Run-in period ) of  $\leq 1000 \mu\text{mol/L}$  or  $> 1000 \mu\text{mol/L}$ .

### 3.7 Interim Analysis

There are no interim analyses planned. The primary analysis will be performed after all subjects complete Part 1 or discontinued from the study. The final analyses will be performed after all subjects have completed the study or discontinued from the study.

## 4 GENERAL ANALYSIS CONSIDERATION

Descriptive summaries of continuous variables will include the mean, standard deviation (SD), median, minimum, and maximum. Descriptive summaries of categorical variables will include n, frequency, and percentage.

### 4.1 Analysis Populations

The All Enrolled population will consist of all subjects (or their parent/guardians, if applicable) who agree to participate in the clinical study following completion of the informed consent process and determination of study eligibility.

The Intent to Treat (ITT) population will consist of all subjects who are randomized. Subjects will be analyzed according to the randomized treatment.

The Safety population will consist of all subjects who received study treatment (pegvaliase or diet-only management of PKU). Subjects will be analyzed according to the treatment actually received during Part 1.

The Per Protocol (PP) population will consist of all subjects in the ITT population who are compliant with the protocol with no major protocol deviations impacting the efficacy analysis. The PP population will be determined by the study team through data review before database lock for primary analysis; reasons for excluding subjects will be defined and documented prior to database lock for primary analysis.

The PK population will consist of all subjects with at least one PK measurement.

### 4.2 Treatment Group Presentation

The following treatment groups will be used in summary tables:

Part 1: pegvaliase (active) or diet-only (control)

Part 2: pegvaliase (subjects continuing on pegvaliase) or diet-only (subjects transitioning from control to pegvaliase)

### 4.3 Pooling of Data from Sites with Small Enrollment

Since the enrollment for each site is expected to be small, the analyses will not be adjusted by site or pooled sites.

### 4.4 Study Day Derivation

Study days will be derived as follows:

Pegvaliase arm: the first dose date will be assigned as Study Day 1

Diet only arm: the Visit 1 date will be assigned as Study Day 1

For visit occurs on or after Study Day 1, Study Day = visit date – day 1 date + 1

For visit occurs before Study Day 1, Study Day = visit date – day 1 date. There is no Study Day 0.

#### 4.4.1 Baseline Definition

The baseline for all safety and efficacy endpoints (when applicable) is defined as the last non-missing measurement collected prior to the first pegvaliase dose (pegvaliase arm) or prior to or on Visit 1 date (diet-only arm), unless otherwise specified.

Baseline blood Phe concentration is defined as the average of 3 pre-treatment measurements collected between screening/Run-in and Day 1 pre-dose.

Baseline total protein intake is defined as the mean total dietary protein intake calculated from the 3 separate 3-day diet diaries collected during Screening/Run-in.

#### 4.5 Visit Window for Analysis

All efficacy and safety data will be summarized by study week of assessment. An assessment for a subject will be classified according to the study day of the assessment where it falls within a window. The windows are designated for each scheduled week of visit and centered on a target day. If there are two or more assessments within a designated window, the assessment that is closest to the target day will be used for analyses. If the two closest assessments to the target day are equidistant from the target day, then for numerical variable, the average of the two assessments will be used for analyses. For categorical variables, the worst of the 2 equidistant measurements, indicating less treatment effect, will be used.

Table 4.5.1 lists the scheduled weeks of the assessments collected in this study and the corresponding range of treatment days (window) during which a visit may have occurred.

**Table 4.5.1: Visit Time Windows for the Treatment Period**

| Randomization arm | Derived Visit                                     | Target Day <sup>a</sup> | Window <sup>b</sup>                              |
|-------------------|---------------------------------------------------|-------------------------|--------------------------------------------------|
| Pegvaliase        | Screening/Day 1                                   | Day 1                   | ≤ Day 1                                          |
|                   | Week 2                                            | Day 8                   | Day 2 to Day 11                                  |
|                   | Week XX ( $3 \leq XX \leq 8$ , every week)        | Day $(XX - 1) * 7 + 1$  | Day $(XX - 1) * 7 - 2$ to Day $(XX - 1) * 7 + 4$ |
|                   | Week 9                                            | Day 57                  | Day 54 to Day 63                                 |
|                   | Week XX ( $11 \leq XX \leq 19$ , every two weeks) | Day $(XX - 1) * 7 + 1$  | Day $(XX - 1) * 7 - 6$ to Day $(XX - 1) * 7 + 7$ |
|                   | Week 21                                           | Day 141                 | Day 134 to Day 154                               |

| Randomization arm | Derived Visit                                      | Target Day <sup>a</sup>         | Window <sup>b</sup>                                                      |

|                   | Week 2                                             | Day 8                           | Day 2 to Day 11                                                          |
|                   | Week XX ( $3 \leq XX \leq 8$ , every week)         | Day $(XX - 1) * 7 + 1$          | Day $(XX - 1) * 7 - 2$ to Day $(XX - 1) * 7 + 4$                         |
|                   | Week 9                                             | Day 57                          | Day 54 to Day 63                                                         |
|                   | Week XX ( $11 \leq XX \leq 19$ , every two weeks)  | Day $(XX - 1) * 7 + 1$          | Day $(XX - 1) * 7 - 6$ to Day $(XX - 1) * 7 + 7$                         |
|                   | Week 21                                            | Day 141                         | Day 134 to Day 154                                                       |
|                   | Week XX ( $13 \leq XX \leq 69$ , every four weeks) | Day $(XX - 1) * 7 + 1$          | Day $(XX - 1) * 7 - 13$ to Day $(XX - 1) * 7 + 14$                       |
|                   | Week 73                                            | Day 505                         | Day 491 to Day 508                                                       |
| Diet-Only Part 2  | Week 73                                            | Day of first dose of pegvaliase | Day of first dose of pegvaliase                                          |
|                   | Week 74                                            | Week 73 day + 7                 | Week 73 day + 1 to Week 73 day + 10                                      |
|                   | Week XX ( $75 \leq XX \leq 80$ , every week)       | Week 73 day + $(XX - 73) * 7$   | Week 73 day + $(XX - 73) * 7 - 3$ to Week 73 day + $(XX - 73) * 7 + 3$   |
|                   | Week 81                                            | Week 73 day + 56                | Week 73 day + 53 to Week 73 day + 62                                     |
|                   | Week XX ( $83 \leq XX \leq 91$ , every week)       | Week 73 day + $(XX - 73) * 7$   | Week 73 day + $(XX - 73) * 7 - 7$ to Week 73 day + $(XX - 73) * 7 + 6$   |
|                   | Week 93                                            | Week 73 day + 56                | Week 73 day + 133 to Week 73 day + 153                                   |
|                   | Week XX ( $XX > 81$ , every four weeks)            | Week 73 day + $(XX - 73) * 7$   | Week 73 day + $(XX - 73) * 7 - 14$ to Week 73 day + $(XX - 73) * 7 + 13$ |

<sup>a</sup> Target days are relative to the Study Day 1.

<sup>b</sup> Visit day is calculated by (visit date – Study Day 1 + 1).

Diet only group: all Part 2 visit is relative to the first dose day of pegvaliase

#### 4.6 Handling of Dropouts and Missing Data

Subjects who discontinued prematurely will not be replaced.

Missing dates or partially missing dates will be imputed conservatively for concomitant medications and AEs to ensure that an AE is considered treatment emergent and has the longest possible duration. Missing data in blood Phe will be handled by multiple imputation method, more details are provided in Section 13.1.1

## **5 SUBJECT DISPOSITION**

The total number of enrolled subjects, the number (%) of subjects who received study treatment, the number (%) of subjects completed Part 1, the number (%) of subjects who completed the study, and the number of subjects in each analysis population (ITT, Safety, PP and PK), as appropriate, will be summarized.

## **6 DISCONTINUATION AND COMPLETION**

For subjects who prematurely discontinue the study, the primary reason for discontinuation will be summarized by treatment group. A similar summary will be provided for subjects who discontinue study treatment. A subject listing of completion and early termination from study will also be provided.

## **7 PROTOCOL DEVIATIONS**

Both important and non-important protocol deviations will also be summarized by deviation category. All protocol deviations will be listed. Subjects with inclusion or exclusion criteria deviations will also be provided in a separate listing.

## **8 DEMOGRAPHICS AND BASELINE CHARACTERISTICS**

Subject demographic and baseline characteristics will be summarized for the ITT population. Demographics include age, age category (12-13, 14-15 and 16-17 years old), gender, race, country and ethnicity. Baseline characteristics include height, weight, BMI, blood Phe concentration, neurocognitive assessment, three-day average dietary intake, restricted diet, genotyping and antibody status.

## **9 MEDICAL HISTORY**

Each subject's chronic diseases, disorders, and surgeries in the past will be collected as general medical history. General medical history will be summarized by System Organ Class (SOC) and Preferred Term (PT) by descending order of frequency. A by-subject listing of each subject's medical history will also be provided.

## 10 PRIOR AND CONCOMITANT MEDICATIONS/PROCEDURES

The following definitions will be used to determine prior and concomitant medications:

- Prior medications: any medications taken prior to first dose administration of pegvaliase (pegvaliase arm) or study day 1 (diet-only arm).
- Concomitant medications: any medications initially taken on or after first dose administration of pegvaliase (pegvaliase arm) or study day 1 (diet-only arm).
- Prior and concomitant medications: any medications taken both prior to and on or after first dose administration of pegvaliase (pegvaliase arm) or study day 1 (diet-only arm) will be reported both as prior and concomitant medications. Therefore, any medications taken prior to first dose administration of pegvaliase (pegvaliase arm) or study day 1 (diet-only arm) where the stop date is reported as “continuing” or missing will be considered as both prior and concomitant medications.

In the event the start date of a medication is partial, the following imputation rules will be applied:

If only day is missing, then the start date will be imputed as the first day of the month, if the year and month is same or after the first dose year and month. If only day is missing, then the start date will be imputed as the last day of the month, if the year and month is prior to the first dose year and month. If month is the same as the month of study day 1 then the start date will be imputed as the date of study day 1.

- If only year is non-missing, then the start date will be imputed as the first day of the year. If year is the same as the year of study day 1 then the start date will be imputed as the date of study day 1.

In the event the stop date of a medication is partial, the following imputation rules will be applied:

- If only day is missing, then the end date will be imputed as the last day of the month.
- If only year is non-missing, then the end date will be imputed as the last day of the year.

All medications will be coded using the current version of the World Health Organization Drug (WHO Drug) dictionary (MMM YYYY). Prior and concomitant medication use will be separately summarized by Anatomical Therapeutic Chemical (ATC) medication class (Level 4) and preferred name (i.e., generic medication name). A subject reporting the same medication use more than once will be counted once when calculating the number and percentage of subjects who received that medication. A subject listing of each subject's prior and concomitant medications will be provided.

## 11 STUDY DRUG USAGE

Study drug usage rate will be calculated based on the drug exposure records captured in eCRFs and dispensed drug amount captured in the Interactive web response system (IWRS).

The overall study drug usage rate will be derived from the total amount of study drug intake divided by the total dispensed study drug amount over the study period and multiplied by 100%. The rate will be calculated for Part 1, Part 2 and overall study period.

## 12 EXTENT OF EXPOSURE TO STUDY TREATMENT

For pegvaliase treatment period, the total number of days on study treatment, total amount of study drug (mg) taken and average daily dose (mg) will be summarized for Part 1, Part 2 and overall study period. Any dose interruption longer than 28 days will be excluded from the total exposure duration calculation.

In addition, the total number of days on diet control treatment will be summarized for pegvaliase and diet-only arm, the summary of protein intake is described in [Section 13.2.1](#)

A by-subject listing of each subject's extent of exposure and compliance will be provided.

## 13 EFFICACY EVALUATIONS

Unless otherwise specified, efficacy analysis will be based on the ITT population.

### 13.1 Primary Efficacy Endpoint

The primary efficacy endpoint is the change from baseline in blood Phe following 72 weeks on study, which is defined as the average of Week 69 and Week 73 blood Phe measurements – baseline blood Phe. Change from baseline in blood Phe will be compared between subjects in the pegvaliase arm and the diet-only arm.

#### 13.1.1 Primary Estimand

Population: the target study population comprises adolescent subjects (ages 12-17) with PKU who meet the inclusion and exclusion criteria as specified in the protocol. The analysis population is the ITT population as defined in Section 4.1

Variable: the variable is the primary efficacy endpoint, change from baseline in blood Phe following 72 weeks on study, as defined in Section 13.1.

Handling of missing data and intercurrent events (ICEs): the treatment policy will be adopted which will include all blood Phe data regardless of intercurrent events such as treatment discontinuation. Missing blood Phe data will be imputed by multiple imputation methods as described in Section 13.1.2.

Population level summary: the difference in change from baseline in blood Phe following 72 weeks on study will be estimated by an Analysis of Covariance (ANCOVA) model with multiple imputation of missing data, as described in Section 13.1.2.

#### 13.1.2 Primary Analysis

The primary efficacy endpoint will be evaluated using an ANCOVA model, which will include baseline blood Phe as covariates and treatment group as factor, with missing data handled by multiple imputation. The imputation will be performed using the SAS procedure PROC MI; the variable list for imputation will include all baseline and post-baseline blood Phe measurements and stratified by treatment. The MCMC method will be used to generate 100 imputation datasets. The least square (LS) mean and 95% confidence interval will be calculated for the treatment difference between pegvaliase and diet-only arms following 72 weeks on study. The primary analysis will be based on the ITT population.

Descriptive summary of observed values, change and percent change from baseline in blood Phe will be provided by visit and treatment. In addition, categorical summary will be performed for the following categories:

In Part 2, change and percent change in blood Phe from average of Week 69 and Week 73 visits will also be summarized for subjects transitioning from control to pegvaliase.

### **13.1.3 Sensitivity Analysis**

The same statistical model used in the primary analysis will be repeated in the PP population.

In addition, the primary analysis model (ANCOVA) will be repeated on the ITT population using 1) observed data only and 2) observed data and missing data imputed by Last Observation Carried Forward (LOCF).

## **13.2 Secondary Endpoints**

The secondary endpoints are as follows:

Change from baseline in total dietary protein intake (i.e., medical food and/or intact food).

The total dietary protein intake following 72 weeks on study is defined as the mean total dietary protein intake calculated from the diet diaries collected at the Week 69 and Week 73 visits.

Plasma sample for trough PK

### **13.2.1 Analysis on Secondary Endpoints**

For the change from baseline in total dietary protein intake, the observed values, change and percent change from baseline at each visit will be summarized by treatment group. Similar summary will also be provided for protein intake from medical food and from intact food separately. The values collected on the three-day diet diary will be averaged for each parameter at each visit before being summarized.

In Part 2, change and percent change in dietary protein intake from average of Week 69 and Week 73 visits will also be summarized for subjects transitioning from control to pegvaliase.

For plasma sample of trough PK, table summary and subject listing of observed value will be provided at each visit. Details of PK analysis of pegvaliase concentration data will be provided in a separate Clinical Pharmacology analysis plan.

## **13.3 Exploratory Endpoints**

The exploratory endpoints are as follows:

The ADHD Rating Scale IV inattention subscale (ADHD-RS IV) rated by the parent/guardian and performed at Baseline (Day 1, pre-dose) and every 12 weeks throughout the study

The Behavior Rating Inventory of Executive Function (BRIEF) rated by the parent/guardian and performed at Baseline (Day 1, pre-dose) and every 12 weeks throughout the study

Time to optimal maintenance dose by age groups (12-15 years and 16-17 years)

Number of patients who require the highest (60mg/day) maintenance dose

Percentage of patients in the blood Phe range of less than 600 µmol/L and less than 360 µmol/L, respectively

### **13.3.1 Analysis on Exploratory Endpoints**

Descriptive summary will be provided for all exploratory endpoints by treatment group.

Observed values and change from baseline for both ADHD-RS IV score and BRIEF score will be summarized at each visit. In Part 2, change in both scores from Week 73 visit will also be summarized for subjects transitioning from control to pegvaliase.

## 14 SAFETY EVALUATIONS

Safety will be assessed by examining the incidence, exposure adjusted event rate, severity grade, and relationship to study drug of all treatment-emergent adverse events (TEAEs) reported during the study period. In addition, clinical laboratory results, vital signs, pregnancy test, physical exam and ECG values will be assessed. In general, safety assessments will be summarized by treatment received in Part 1 (pegvaliase and diet-only) and in Part 1 and 2 (pegvaliase and diet-only).

### 14.1 Adverse Events

AEs will be coded in accordance with the MedDRA (version xx). Only treatment-emergent adverse events (TEAEs) occurring and reported during the study period will be included in adverse event summaries. A TEAE is defined as any AE that newly appeared or worsened in severity after first dose of pegvaliase (pegvaliase arm) or on or after study day 1 (diet-only arm) until 30 days after last dose of the study. If the onset date of an AE is missing, the AE will be considered treatment-emergent.

In Part 2 subjects transitioning from control to pegvaliase, a TEAE occurred during pegvaliase treatment period is defined as any AE that appeared or worsened in severity after first dose of pegvaliase until 30 days after last dose.

#### 14.1.1 All Adverse Events

The incidence and frequency of all treatment-emergent AEs will be summarized by system organ class (SOC), preferred term (PT), relationship to study drug and National Cancer Institute (NCI) Common Terminology Criteria for Adverse Events (CTCAE) severity grades. For AEs that occurred more than once during the study, the maximum severity will be used to summarize the AEs by severity.

If the onset date or end date of an adverse event is partial, the same imputation rules described in Section 10 will be applied.

The following summary will be performed for treatment-emergent AEs:

- All AEs by SOC and PT
- All AEs by SOC, PT and severity
- AEs assessed by investigators as related to study drug by SOC and PT
- AEs assessed by investigators as related to study drug by SOC, PT and severity
- Serious AEs (SAEs) by SOC and PT
- All AEs by PT in descending frequency order

- All AEs by SOC and PT with exposure adjusted event rate
- AEs leading to withdrawal from study by SOC and PT
- AEs leading to study drug discontinuation by SOC and PT

In addition, summary tables and listings will be provided for AEs of special interest:

- Acute systemic hypersensitivity reaction (refer to [Appendix 1](#))
- Anaphylaxis per FDA criteria (refer to [Appendix 1](#))
- Angioedema
- Serum sickness
- Severe injection site reaction defined as an injection site reaction that is considered CTCAE Grade  $\geq 3$
- Hypophenylalaninemia events (defined as blood Phe  $< 30 \mu\text{mol/L}$  on 2 consecutive measurements)
- Arthralgia that is either persistent (AE duration  $> 6$  months), severe (CTCAE Grade  $\geq 3$ ), or that requires treatment with a steroid (excluding topical)

#### 14.2 Clinical Laboratory Tests

Descriptive statistics will be presented for clinical laboratory tests at each scheduled visit and for change in laboratory values from baseline. The proportion of subjects who experienced at least one laboratory test result outside the normal ranges will be presented for each measurement as appropriate. Shift table from baseline to most extreme post-baseline value based on normal range and based on CTC grading (where available) will also be generated for each parameter as appropriate. A subject listing of laboratory test results for hematology, chemistry, urinalysis, and other laboratory tests will be provided separately. Values with CTC grade as 3 or above will be flagged in the listings.

A listing of laboratory test results for subjects with alanine transaminase (ALT) or alanine aminotransferase (AST)  $\geq 3\text{xULN}$  and total bilirubin  $\geq 2\text{xULN}$  will also be provided.

#### 14.3 Vital Signs

Vital signs will include systolic blood pressure (SBP) and diastolic blood pressure (DBP) measured in millimeters of mercury (mm Hg), heart rate in beats per minute, respiration rate in breaths per minute, and temperature in degrees Celsius ( $^{\circ}\text{C}$ ).

Summary statistics including n, mean, SD, median, minimum, and maximum will be provided for these parameters at each visit. A subject listing will also be provided.

#### **14.4 12-lead Electrocardiogram**

The frequency of abnormalities and clinically significant abnormalities in 12-lead electrocardiogram will be summarized at each visit. A subject listing of ECG findings will be provided.

#### **14.5 Physical Examination**

Physical examinations will include assessments of general appearance; head, eyes, ears, nose, and throat; the cardiovascular, dermatologic, lymphatic, respiratory, gastrointestinal, musculoskeletal, and neurologic systems. Other body systems may be examined if needed. A subject listing for clinically significant findings at each visit will be provided.

#### **14.6 Immunogenicity Tests**

Immunogenicity will be performed using validated immunogenicity assays. Immunogenicity assays include total anti-pegvaliase antibodies (TAbs), anti-PAL IgG, anti-PAL IgM, anti-PEG IgM, anti-PEG IgG, and neutralizing antibodies (NAb). In the event of a Hypersensitivity Reaction visit (HRV), anti-pegvaliase IgE will be assessed.

For immunogenicity analysis, incidence tables and titer summary statistics including mean, median, standard deviation, and minimum/maximum titer values at each study visit will be provided for each antibody analyte.

Anti-drug antibody impact on safety will be evaluated. Plots and tables will be generated to explore the potential impact of anti-drug antibodies on HAE frequency and severity. A listing will be provided for each subject who has Hypersensitivity Reaction Visit.

Anti-drug antibody impact on efficacy will be evaluated. Plots and tables may be generated to explore the potential impact of anti-drug antibodies on blood Phe levels.

#### **14.7 Pregnancy Test**

A subject listing for pregnancy urine sample test at each visit will be provided.

## 15 APPENDICES

### Appendix 1: Search Strategies for Adverse Event of Special Interest, and Sponsor Defined AEs of Clinical Significance

MedDRA version: most current version at program termination

#### 1. Anaphylaxis per NIAID/FAAN criteria

Anaphylaxis per NIAID/FAAN is defined using the NIAID/FAAN clinical diagnostic criteria through review on the potential anaphylaxis per NIAID/FAAN cases, which are identified using Broad algorithmic anaphylactic reaction SMQ with the below algorithm:

Algorithm = A or (B and C) or (D and (B or C))

| Name of Search                              | Category | Preferred Term                    |
|---------------------------------------------|----------|-----------------------------------|
| Broad Algorithmic Anaphylactic Reaction SMQ | A        | Anaphylactic reaction             |
|                                             | A        | Anaphylactic shock                |
|                                             | A        | Anaphylactic transfusion reaction |
|                                             | A        | Anaphylactoid reaction            |
|                                             | A        | Anaphylactoid shock               |
|                                             | A        | Circulatory collapse              |
|                                             | A        | Dialysis membrane reaction        |
|                                             | A        | Kounis syndrome                   |
|                                             | A        | Procedural shock                  |
|                                             | A        | Shock                             |
|                                             | A        | Shock symptom                     |
|                                             | A        | Type I hypersensitivity           |
|                                             | B        | Acute respiratory failure         |
|                                             | B        | Asthma                            |
|                                             | B        | Bronchial oedema                  |
|                                             | B        | Bronchospasm                      |
|                                             | B        | Cardio-respiratory distress       |
|                                             | B        | Chest discomfort                  |
|                                             | B        | Choking                           |

## **2. Acute systemic hypersensitivity reaction**

An acute systemic hypersensitivity reaction (referred to as anaphylaxis in the protocol) is defined as an episode meeting National Institute of Allergy and Infectious Disease/Food Allergy and Anaphylaxis Network (NIAID/FAAN) criteria according to an internal BioMarin assessment performed by the Internal Data Safety Review Board,

## **3. Anaphylaxis per FDA criteria**

Anaphylaxis events defined according to the DPARP methodology are referred to as “anaphylaxis per FDA criteria”. The FDA’s assessment methodology includes individual case safety reports with any of the following characteristics:

- Clinical manifestations consistent with NIAID/FAAN Criterion #1 (skin involvement + respiratory or cardiovascular compromise); or
- Verbatim reports of anaphylaxis/anaphylactic reaction (or synonyms), even if NIAID/FAAN criteria were not met; or
- Cases involving subject injection of epinephrine alone, even if subject did not experience signs/symptoms necessary to meet NIAID/FAAN criteria.

#### 4. Angioedema per sponsor criteria

A 2-step process to identify angioedema per sponsor criteria, the following assessment was performed on the entire AE dataset:

- Step 1: all reported ADRs suggestive of angioedema using the Angioedema MedDRA HLT search, which includes the following 21 PTs: angioedema, circumoral oedema, eyelid oedema, face oedema, Gleich's syndrome, hereditary angioedema, idiopathic angioedema, intestinal angioedema, laryngeal oedema, laryngotracheal oedema, lip oedema, lip swelling, mouth swelling, oculorespiratory syndrome, oedema mouth, oropharyngeal swelling, periorbital oedema, pharyngeal oedema, swelling face, swollen tongue, and tongue oedema.
- Step 2: BioMarin then clinically assessed the retrieved data identified from Step 1 to assign concurrent events into episodes and to exclude:
  - False positive ADR reports that have clear confounders which impact assessment, e.g., onset of event(s)  $\geq 30$  days after last dose or events/episodes with a very clear alternative etiology, such as throat swelling secondary to intubation). Cases were not excluded where the events have a long duration which may be atypical for angioedema, or where events occurred concurrent with other conditions which may have contributed to their development (e.g., eye swelling reported during episode(s) of seasonal allergy).
  - Episodes which occurred as part of an acute systemic hypersensitivity reaction and, therefore, will already be included in the incidence for acute systemic hypersensitivity reactions (to avoid duplication).

In the sponsor's opinion, the methodology described above is more likely to be reflective of the true incidence of angioedema manifestations.

#### 5. Serum Sickness

Serum sickness-like reaction will be defined by including all preferred term of serum sickness, serum sickness-like reactions and Type III immune complex mediated reactions.

#### 6. Severe Injection-site reaction

Severe injection site reaction will be identified as any injection site reaction report that is reported as Common Terminology Criteria for Adverse Events (CTCAE) Grade 3 or above in severity and meeting MedDRA high level term (HLT) for Injection site reaction.

#### 7. Hypophenylalaninemia

Hypophenylalaninemia is defined as a blood phenylalanine (Phe) level  $\leq 30$   $\mu\text{mol/L}$  for a minimum of 2 consecutive values, with the start of the event defined as the first blood Phe assessment day with  $< 30$   $\mu\text{mol/L}$  and the end of the event defined as the day prior to the first blood Phe assessment  $\geq 30$   $\mu\text{mol/L}$ .

**8. Severe or Persistent (> 6 months) arthralgia**

Arthralgia will be identified as the preferred terms of arthralgia, pain in extremity, back pain, musculoskeletal pain, and neck pain. Persistent arthralgia is defined as any arthralgia event that has a duration of the event > 6 months (Multiple AE records with same reported term and  $\leq 1$  day difference between the start date and end date are considered as same event). Severe arthralgia is defined as any arthralgia event that is reported as CTCAE Grade 3 or above in severity.

## 2 INTRODUCTION

Study 165-306 is an open-label, two-arm (Active vs Diet-only Control), randomized control study to evaluate safety and efficacy of pegvaliase and characterize the PK of pegvaliase in adolescent participants with phenylketonuria (PKU).

The purpose of this Statistical Analysis Plan (SAP) is to provide a comprehensive description of methods of the data analyses outlined in the protocol (amendment 2 dated 23 October 2023).

If discrepancies exist between the text of the statistical analysis as planned in the protocol and the final SAP, the SAP will prevail. The discrepancies will be documented in the clinical study report (CSR).

### 2.1 Objectives of Study

The primary objective of the study is:

- To evaluate the efficacy of pegvaliase in adolescent participants with PKU
- To evaluate the safety of pegvaliase in adolescent participants with PKU

The secondary objectives of the study are:

- To characterize total dietary protein intake in adolescent participants with PKU after pegvaliase treatment
- To characterize the pharmacokinetics (PK) of pegvaliase in adolescent participants with PKU

The exploratory objectives of the study are:

- To evaluate the effect of pegvaliase treatment on neurocognitive outcomes in adolescent participants with PKU
- To assess changes in PKU symptoms and impacts
- To compare participants' optimal maintenance pegvaliase dose across different age groups within the study
- Explore the biochemical, molecular, and cellular aspects of PKU
- PAH genotyping

### 2.2 Study Design

This is an open-label, two arm, randomized controlled study. Approximately 54 US and EU participants (ages 12 to 17 years old (US), inclusive, and 12 to 15 years old (EU), inclusive) with diet-only control will be enrolled. At enrollment, participants will be randomized 2:1 to the active (pegvaliase) and control (diet-only) treatment arms, with approximately 36 participants receiving daily pegvaliase and 18 participants managing PKU by diet alone. Treatment assignment will be stratified by Screening/Run-in blood Phe (mean of the 2 pre-

treatment blood Phe assessments performed during the Screening/Run-in period) of  $\leq 1000 \mu\text{mol/L}$  or  $> 1000 \mu\text{mol/L}$ . Participants in the active and control arms will follow the same visit schedules and perform the same assessments throughout the 72-week Primary Treatment Phase (Part 1) except that the control participants will not be receiving pegvaliase so will not have PK draws or immunogenicity assessments.

After providing informed consent, participants will enter the Screening/Run-in period, which will last 4 weeks and include 2 assessments of blood Phe levels, 7 to 10 days apart, to determine eligibility. Following confirmation that the 2 blood Phe results are  $> 600 \mu\text{mol/L}$  and all other eligibility criteria have been met, participants may be enrolled in the study on Day 1. During the Screening/Run-in and the Primary Treatment Phase (Part 1), participants will be required to maintain stable protein intake from both medical food and/or intact food.

The duration of Part 1 is 72 weeks, during which pegvaliase treatment will be initiated for participants in the active arm using an Induction/Titration/Maintenance (I/T/M) dosing regimen. The I/T/M dosing regimen consists of an Induction/Titration Dosing (9 weeks) and a Maintenance Dosing. Required hospital setting visits during Part 1 will occur for all dosing visits for the first 8 weeks, every 4 weeks thereafter, and when the pegvaliase dose is escalated to 20, 40 or 60 mg/day. The assessments performed at the clinic visits include measurement of blood Phe, neurocognitive assessments, PK blood draws (active participants only), and safety assessments.

Beginning Week 73, participants in the active treatment arm will continue to receive pegvaliase in the Extension Phase (Part 2) for up to 142 additional weeks (through Week 215). Beginning Week 73, participants in the control treatment arm will initiate pegvaliase treatment and, from Weeks 73 through 215, will follow the same schedule for dosing, study visits, and assessments that the active arm participants followed for pegvaliase dosing starting from Study Day 1.

### 2.3 Study Population

Individuals with PKU aged 12 to 17 years old (US), inclusive, and 12 to 15 years old (EU), inclusive with diet-only control at the start of the Screening/Run-in Period (Day -28) are candidates for participation in the study. Additional criteria for study participation are presented in Protocol 165-306 Section 5.1 and Section 5.2.

### 2.4 Study Dosage and Administration

Participants will receive pegvaliase at a concentration of 5.0 or 20.0 mg/mL. Pegvaliase will be administered subcutaneously at dose levels in the range of 2.5 to 60 mg. The minimum

dose of pegvaliase is 2.5 mg/week. The maximum allowable daily dose of pegvaliase is 60 mg/day (for a maximum weekly total dose of 420 mg).

## 2.5 Sample Size Determination

Approximately 54 participants will be enrolled and randomized to the pegvaliase or diet-only groups in 2:1 ratio. Assuming a mean (SD) reduction in Phe following 72 weeks on study is 640 (570)  $\mu\text{mol/L}$  in the pegvaliase group and 100 (250)  $\mu\text{mol/L}$  in the diet-only group, a total sample size of 54 participants will provide more than 90% power to detect a treatment difference, based on the two-sample T-test with unequal variance and a significance level of 0.05 (two sided).

Approximately 72 participants will be screened for study participation such that approximately 54 participants will be enrolled in the study.

For the pegvaliase treatment arm, the mean (SD) assumption of reduction in blood Phe is based on participants 16 to 24 years of age who completed 17 months of treatment in previous pegvaliase studies utilizing an I/T/M dosing regimen ( $n = 46$ ). For the diet-only arm, the mean (SD) assumption of reduction in blood Phe is based on BioMarin's PKUDOS (Phenylketonuria Demographic, Outcomes, and Safety) registry for patients aged 12 to <18 years old on diet only control with baseline Phe > 600  $\mu\text{mol/L}$  at year 1 of study enrollment ( $n = 57$ ).

## 2.6 Blinding and Randomization Methods

### 2.6.1 Blinding Method

Participants will receive open-label pegvaliase or diet-only treatment.

### 2.6.2 Randomization Method

Participants will be randomized in a 2:1 ratio to the active (pegvaliase) or control (diet-only) treatment arm, respectively. Treatment assignment will be stratified by Screening/Run-In blood Phe (mean of the 2 pre-treatment blood Phe assessments performed during the Screening/Run-in period) of  $\leq 1000 \mu\text{mol/L}$  or  $> 1000 \mu\text{mol/L}$ .

## 2.7 Interim Analysis

There are no interim analyses planned. The primary analysis will be performed after all participants complete Part 1 or discontinued from the study. The final analyses will be performed after all participants have completed the study or discontinued from the study.

### 3 GENERAL ANALYSIS CONSIDERATION

Descriptive summaries of continuous variables will include n, mean, standard deviation (SD), median, minimum, and maximum. Descriptive summaries of categorical variables will include n, frequency, and percentage.

#### 3.1 Analysis Populations

The All Enrolled population will consist of all participants who agree to participate in the clinical study (by their parent/guardians, if applicable) following completion of the informed consent process and determination of study eligibility.

The Intent to Treat (ITT) population will consist of all participants who are randomized. Participants will be analyzed according to the randomized treatment for the analysis of efficacy.

The Safety population will consist of all participants who received at least one dose of study treatment (pegvaliase or diet-only management of PKU). Subjects will be analyzed according to the treatment actually received for the analysis of safety.

The Per Protocol (PP) population will consist of all participants in the ITT population who are compliant with the protocol with no important protocol deviations impacting the primary efficacy analysis. The PP population will be determined by the study team through data review before database snapshot for primary analysis; reasons for excluding participants will be defined and documented prior to database snapshot for primary analysis.

The PK population will consist of all participants who received pegvaliase with at least one PK measurement.

#### 3.2 Treatment Group Presentation

The following treatment groups will be used in summary tables:

Part 1: pegvaliase (active) or diet-only (control)

Part 2: pegvaliase (participants continuing on pegvaliase) or diet-only (participants transitioning from control to pegvaliase)

#### 3.3 Pooling of Data from Sites with Small Enrollment

Since the enrollment for each site is expected to be small, the analyses will not be performed by site or pooled sites.

### 3.4 Study Day Derivation

Study days will be derived as follows:

Pegvaliase arm: the first dose date will be assigned as Study Day 1

Diet only arm: the Visit 1 date will be assigned as Study Day 1

For visit occurs on or after Study Day 1, Study Day = visit date – day 1 date + 1

For visit occurs before Study Day 1, Study Day = visit date – day 1 date. There is no Study Day 0.

#### 3.4.1 Baseline Definition

The baseline for all safety and efficacy endpoints (when applicable) is defined as the last non-missing measurement collected prior to the first pegvaliase dose (pegvaliase arm) or prior to or on Visit 1 date (diet-only arm), unless otherwise specified:

Baseline blood Phe concentration at Part 1 is defined as the average of 3 pre-treatment measurements collected between screening/Run-in (2) and Day 1 pre-dose (1). Baseline blood Phe concentration at Part 2 is defined as the average of week 69 and week 73 measurements.

Baseline total protein intake at Part 1 is defined as the mean total dietary protein intake calculated from the 3 separate 3-day diet diaries collected during Screening/Run-in (2) and Day 1 (1). Baseline total protein intake at Part 2 is defined as the average of week 69 and week 73 measurements

For other measurements,

- Pegvaliase:
  - Baseline for the whole study period: last non-missing measurement prior to first pegvaliase dose
- Diet only:
  - Baseline for Part 1: last non-missing measurement prior to visit day 1
  - Baseline for Part 2: measurements taken prior to first dose of pegvaliase at Week 73

#### 3.4.2 Treatment Period and Phase

Pegvaliase treatment period is defined from study Day 1 until 30 days after last dose.

Definitions of Induction, titration and maintenance phase during pegvaliase treatment period are as follows:

**Induction:** When subjects are on a 2.5 mg weekly dose.

**Titration:** When subjects have completed the induction phase and begin to increase dose and dosing frequency until they meet the criterion for the Maintenance Phase.

**Induction/Titration:** The treatment period prior to the start of Maintenance Phase.

**Maintenance (first occurrence):**

- US: Completion of an 8-week period with at least 80% compliance at the same dose. The start of maintenance phase is at the end of the 8-week period.
- EU: when subjects have at least a 26-day period with all blood Phe assessments  $\leq 600 \mu\text{mol/L}$  and are on stable dose, which is defined as on same dose with at least 80% compliance rate. The start of maintenance phase is the date of the first Phe assessment at which the above criteria are met.

Diet-only period is defined from study Day 1 until the day before first dose of pegvaliase or 30 days after early termination, whichever occurs earlier.

### 3.5 Visit Window for Analysis

All efficacy and safety data will be summarized by study week of assessment. An assessment for a subject will be classified according to the study day of the assessment where it falls within a window. The windows are designated for each scheduled week of visit and centered on a target day. If there are two or more assessments within a designated window, the assessment that is closest to the target day will be used for analyses. If the two closest assessments to the target day are equidistant from the target day, then for numerical variable, the average of the two assessments will be used for analyses. For categorical variables, the worst of the 2 equidistant measurements, indicating less treatment effect, will be used.

Table 3.5.1 lists the scheduled weeks of the assessments collected in this study and the corresponding range of treatment days (window) during which a visit may have occurred.

**Table 3.5.1: Visit Time Windows for the Treatment Period**

| Pegvaliase | Derived Visit                                       | Target Day <sup>a</sup> | Window <sup>b</sup>                                |
|------------|-----------------------------------------------------|-------------------------|----------------------------------------------------|
|            | Screening/Day 1                                     | Day 1                   | ≤ Day 1                                            |
|            | Week 2                                              | Day 8                   | Day 2 to Day 11                                    |
|            | Week XX ( $3 \leq XX \leq 8$ , every week)          | Day $(XX - 1) * 7 + 1$  | Day $(XX - 1) * 7 - 2$ to Day $(XX - 1) * 7 + 4$   |
|            | Week 9                                              | Day 57                  | Day 54 to Day 63                                   |
|            | Week XX ( $11 \leq XX \leq 19$ , every two weeks)   | Day $(XX - 1) * 7 + 1$  | Day $(XX - 1) * 7 - 6$ to Day $(XX - 1) * 7 + 7$   |
|            | Week 21                                             | Day 141                 | Day 134 to Day 154                                 |
|            | Week XX ( $25 \leq XX \leq 209$ , every four weeks) | Day $(XX - 1) * 7 + 1$  | Day $(XX - 1) * 7 - 13$ to Day $(XX - 1) * 7 + 14$ |
|            | Week 213                                            | Day 1485                | Day 1471 to Day 1491                               |
|            | Week 215                                            | Day 1499                | ≥ Day 1492                                         |

| Diet-Only | Derived Visit                                      | Target Day <sup>a</sup> | Window <sup>b</sup>                                |
|-----------|----------------------------------------------------|-------------------------|----------------------------------------------------|
| Part 1    | Screening/Day 1                                    | Day 1                   | ≤ Day 1                                            |
|           | Week 2                                             | Day 8                   | Day 2 to Day 11                                    |
|           | Week XX ( $3 \leq XX \leq 8$ , every week)         | Day $(XX - 1) * 7 + 1$  | Day $(XX - 1) * 7 - 2$ to Day $(XX - 1) * 7 + 4$   |
|           | Week 9                                             | Day 57                  | Day 54 to Day 70                                   |
|           | Week XX ( $13 \leq XX \leq 69$ , every four weeks) | Day $(XX - 1) * 7 + 1$  | Day $(XX - 1) * 7 - 13$ to Day $(XX - 1) * 7 + 14$ |
|           | Week 73                                            | Day 505                 | Day 491 to Day of first dose of pegvaliase         |

|        |                                              |                                 |                                                                        |
|--------|----------------------------------------------|---------------------------------|------------------------------------------------------------------------|
| Part 2 | Week 73                                      | Day of first dose of pegvaliase | Day of first dose of pegvaliase                                        |
|        | Week 74                                      | Week 73 day + 7                 | Week 73 day + 1 to Week 73 day + 10                                    |
|        | Week XX ( $75 \leq XX \leq 80$ , every week) | Week 73 day + $(XX - 73) * 7$   | Week 73 day + $(XX - 73) * 7 - 3$ to Week 73 day + $(XX - 73) * 7 + 3$ |
|        | Week 81                                      | Week 73 day + 56                | Week 73 day + 53 to Week 73 day + 62                                   |

|  |                                                     |                           |                                                                  |
|--|-----------------------------------------------------|---------------------------|------------------------------------------------------------------|
|  | Week XX ( $83 \leq XX \leq 91$ , every two weeks)   | Week 73 day + (XX - 73)*7 | Week 73 day + (XX - 73)*7 - 7 to Week 73 day + (XX - 73)*7 + 6   |
|  | Week 93                                             | Week 73 day + 140         | Week 73 day + 133 to Week 73 day + 153                           |
|  | Week XX ( $97 \leq XX \leq 209$ , every four weeks) | Week 73 day + (XX - 73)*7 | Week 73 day + (XX - 73)*7 - 14 to Week 73 day + (XX - 73)*7 + 13 |
|  | Week 213                                            | Day 1485                  | Week 73 day + 966 to Week 73 day + 986                           |
|  | Week 215                                            | Day 1499                  | $\geq$ Week 73 day + 987                                         |

<sup>a</sup> Target days are relative to the Study Day 1.

<sup>b</sup> Visit day is calculated by (visit date – Study Day 1 + 1).

Diet only group: all Part 2 visit is relative to the first dose day of pegvaliase

### 3.6 Handling of Dropouts and Missing Data

Participants who discontinued prematurely will not be replaced.

Missing dates or partially missing dates will be imputed conservatively for concomitant medications and AEs to ensure that an AE is considered treatment emergent when possible and has the longest possible duration. If the onset date of an AE is completely missing, the AE will be considered treatment-emergent. Missing data in blood Phe will be handled by multiple imputation method, more details are provided in Section 12.1.1

## 4 SUBJECT DISPOSITION

The total number of enrolled participants, the number (%) of participants who received study treatment, the number (%) of participants completed Part 1, the number (%) of participants who completed the study, and the number of participants in each analysis population (ITT, Safety, PP and PK), as appropriate, will be summarized.

## 5 DISCONTINUATION AND COMPLETION

For participants who prematurely discontinue the study, the primary reason for discontinuation will be summarized by treatment group. A similar summary will be provided for participants who discontinue study treatment. A subject listing of completion and early termination from study will also be provided.

## 6      **PROTOCOL DEVIATIONS**

Both major and minor protocol deviations will be summarized by deviation category. All protocol deviations will be listed. Participants with inclusion or exclusion criteria deviations will also be provided in a separate listing.

## 7      **DEMOGRAPHICS AND BASELINE CHARACTERISTICS**

Subject demographic and baseline characteristics will be summarized for the ITT population. Demographics include age, age category (12 to < 16 and 16 to < 18 years old), gender, race, country and ethnicity. Baseline characteristics include height, weight, BMI, blood Phe concentration, neurocognitive assessment, three-day average dietary intake, restricted diet, genotyping and antibody status.

## 8      **MEDICAL HISTORY**

Each subject's chronic diseases, disorders, and surgeries in the past will be collected as general medical history. General medical history will be summarized by System Organ Class (SOC) and Preferred Term (PT) by descending order of frequency. A by-subject listing of each subject's medical history will also be provided.

## 9      **PRIOR AND CONCOMITANT MEDICATIONS/PROCEDURES**

The following definitions will be used to determine prior and concomitant medications:

- Prior medications: any medications taken prior to first dose administration of pegvaliase (pegvaliase arm) or study day 1 (diet-only arm).
- Concomitant medications: any medications initially taken on or after first dose administration of pegvaliase (pegvaliase arm) or study day 1 (diet-only arm).
- Prior and concomitant medications: any medications taken both prior to and on or after first dose administration of pegvaliase (pegvaliase arm) or study day 1 (diet-only arm) will be reported both as prior and concomitant medications. Therefore, any such medications where the stop date is reported, reported as "continuing", or missing will be considered as both prior and concomitant medications.

In the event the start date of a medication is partial, the following imputation rules will be applied:

- If only day is missing, then the start date will be imputed as the first day of the month, if the year and month is same or after the study day 1 year and month. If only day is missing, then the start date will be imputed as the last day of the month, if the year and month is prior to the first dose year and month. If year and month are the same as

the year and month of study day 1 then the start date will be imputed as the date of study day 1.

- If only year is non-missing, then the start date will be imputed as the first day of the year if the year is after the year of study day 1. If year is the same as the year of study day 1 then the start date will be imputed as the date of study day 1. If year is before the year of study day 1 then start date will be imputed to the last date of the year.

In the event the stop date of a medication is partial, the following imputation rules will be applied:

- If only day is missing, then the end date will be imputed as the last day of the month.
- If only year is non-missing, then the end date will be imputed as the last day of the year.

All medications will be coded using the current version of the World Health Organization Drug (WHO Drug) dictionary (September 2021). Prior and concomitant medication use will be separately summarized by Anatomical Therapeutic Chemical (ATC) medication class (Level 4) and preferred name (i.e., generic medication name). A subject reporting the same medication use more than once will be counted once when calculating the number and percentage of participants who received that medication. A subject listing of each subject's prior and concomitant medications will be provided.

## 10 STUDY DRUG USAGE

Study drug usage rate will be calculated based on the drug exposure records captured in eCRFs and dispensed drug amount captured in the Interactive web response system (IWRS).

The overall study drug usage rate will be derived from the total amount of study drug intake divided by the total dispensed study drug amount over the study period and multiplied by 100%. The rate will be calculated for Part 1, Part 2 and overall study period.

## 11 EXTENT OF EXPOSURE TO STUDY TREATMENT

For pegvaliase treatment period, the total number of days on study treatment, total amount of study drug (mg) taken and average daily dose (mg) will be summarized for Part 1, Part 2 and overall study period. Any dose interruption longer than 28 days will be excluded from the total exposure duration calculation.

In addition, the total number of days on diet control treatment period will be summarized for diet-only arm, the summary of protein intake is described in Section [12.2.1](#)

A by-subject listing of each subject's extent of exposure and compliance will be provided.

Compliance for pegvaliase will be calculated by the total amount of study drug intake divided by the total amount of study drug dispensed, and multiplied by 100%

## 12 EFFICACY EVALUATIONS

Unless otherwise specified, efficacy analysis will be based on the ITT population.

### 12.1 Primary Efficacy Endpoint

The primary efficacy endpoint is the change from baseline in blood Phe following 72 weeks on study. The blood Phe measurement following 72 weeks on study is defined as the average of the Week 69 and Week 73 blood Phe measurements. Change from baseline in blood Phe will be compared between participants in the active (pegvaliase) and the control (diet-only) treatment arms.

#### 12.1.1 Primary Estimand

Population: the target study population comprises adolescent participants (ages 12-17) with PKU who meet the inclusion and exclusion criteria as specified in the protocol. The analysis population is the ITT population as defined in Section 3.1

Variable: the variable is the primary efficacy endpoint, change from baseline in blood Phe following 72 weeks on study, as defined in Section 12.1.

Handling of missing data and intercurrent events (ICEs): the treatment policy strategy will be adopted which will include all blood Phe data regardless of intercurrent events such as treatment discontinuation. Missing blood Phe data will be imputed by multiple imputation methods as described in Section 12.1.2.

Population level summary: the difference in change from baseline in blood Phe following 72 weeks on study will be estimated by an Analysis of Covariance (ANCOVA) model with multiple imputation of missing data, as described in Section 12.1.2.

#### 12.1.2 Primary Analysis

The primary efficacy endpoint will be evaluated using an ANCOVA model, which will include baseline blood Phe levels as covariates, randomization strata (baseline Phe  $\leq 1000$   $\mu\text{mol/L}$  or  $> 1000$   $\mu\text{mol/L}$ ) and treatment group as factors, with missing data handled by multiple imputation. The imputation will be performed using the SAS procedure PROC MI; the variable list for imputation will include all baseline and post-baseline blood Phe measurements and stratified by treatment. The MCMC method will be used to generate 100 imputation datasets. The least square (LS) mean and 95% confidence interval will be calculated for the treatment difference between pegvaliase and diet-only arms following 72 weeks on study. The primary analysis will be based on the ITT population.

Descriptive summary of observed values, change and percent change from baseline in blood Phe will be provided by visit and treatment

In Part 2, change and percent change in blood Phe from average of Week 69 and Week 73 visits will also be summarized for participants transitioning from control to pegvaliase by visits scheduled in Part 2.

### 12.1.3 Sensitivity Analysis

The same statistical model used in the primary analysis will be repeated in the PP population.

In addition, the primary analysis model (ANCOVA) will be repeated on the ITT population using 1) observed data only and 2) observed data and missing data imputed by Last Observation Carried Forward (LOCF).

## 12.2 Secondary Endpoints

The secondary endpoints are as follows:

- Change from baseline in total dietary protein intake (i.e., medical food and/or intact food) following 72 weeks on study. The total dietary protein intake following 72 weeks on study is defined as the mean total dietary protein intake calculated from the diet diaries collected at the Week 69 and Week 73 visits. Total dietary protein is measured in grams/kilogram (g/kg).
- Plasma sample for trough PK

### 12.2.1 Analysis on Secondary Endpoints

For the change from baseline in total dietary protein intake, the observed values, change and percent change from baseline at each visit will be summarized by treatment group. Similar summary will also be provided for protein intake from medical food and from intact food separately. The values collected on the three-day diet diary will be averaged for each parameter at each visit before being summarized.

In Part 2, change and percent change in dietary protein intake from average of Week 69 and Week 73 visits will also be summarized for participants transitioning from control (diet-only) treatment arm to pegvaliase.

For plasma sample of trough PK, table summary and subject listing of observed value will be provided at each visit. The PK parameters derived from the intensive PK samples will also be summarized. Details of PK analysis of pegvaliase concentration data will be provided in a separate Clinical Pharmacology analysis plan.

### 12.3 Exploratory Endpoints

The exploratory endpoints are as follows:

- The ADHD Rating Scale IV inattention subscale (ADHD-RS IV) rated by the parent/guardian and performed at Baseline (Day 1, pre-dose) and every 12 weeks throughout the study
- The Behavior Rating Inventory of Executive Function, Second Edition (BRIEF2) rated by the parent/guardian and performed at Baseline (Day 1, pre-dose) and every 12 weeks throughout the study
- Change from baseline (or first administration) in Phenylketonuria Symptom Severity and Impacts Scale (PKU-SSIS) Version 2.0 scores
- Change from baseline (or first administration) in global severity items (Patient Global Impression of Severity [PGIS], Caregiver Global Impression of Severity [CaGIS], and Clinician Global Impression of Severity [CGIS])
- Change in global change items (Patient Global Impression of Change [PGIC] and Caregiver Global Impression of Change [CaGIC]) Time to participants' optimal maintenance dose
- Number of patients who require the highest (60mg/day) maintenance dose
- Percentage of patients in the blood Phe ranges of less than 600  $\mu\text{mol/L}$  and less than 360  $\mu\text{mol/L}$ , respectively

#### 12.3.1 Analysis on Exploratory Endpoints

##### 12.3.1.1 The ADHD Rating Scale IV (ADHD RS-IV) Inattention Subscale

The ADHD RS-IV instrument is completed independently by the parent/guardian. The same parent/guardian must complete the scale at each scheduled time point. The instrument consists of 2 nine-item scales that evaluate symptom severity for inattention and hyperactivity/impulsivity, respectively, during the previous month. Each scale is scored separately. Each item is rated on a 4-point severity scale (0, none; 1, mild; 2, moderate; 3, severe); scores of 2 or 3 on an individual item indicate a symptom.

ADHD-RS Inattention (IA) subscale is the sum of the 9 odd-numbered items.

ADHD-RS Hyperactivity-Impulsivity (HI) subscale is the sum of the 9 even-numbered items

ADHD-RS total score will be the sum of ADHD-RS IA and ADHD-RS HI

#### **12.3.1.2 Behavior Rating Inventory of Executive Function, Second Edition (BRIEF2)**

The BRIEF2 is a 63-item measure in 8 non-overlapping clinical scales and 2 validity scales. It is designed to assess executive function skills in children 5 to 18 years of age (Gioia 2002). The same parent/guardian must complete the BRIEF2 at each scheduled time point. These scales form 2 indexes: (1) Behavior Regulation (3 scales) and (2) Metacognition (5 scales), as well as a Global Executive Composite score which takes into account all of the clinical scales and represents the adolescent's overall executive function.

Behavior Regulation Index (BRI), Emotion Regulation Index (ERI), Cognitive Regulation Index (CRI) and Global Executive Composite (GEC) will be summarized, and their definition are as follows:

BRI = Inhibit + Self-Monitor

ERI = Shift + Emotional Control

CRI = Initiate + Working Memory + Plan/Organize + Task-Monitor + Organization of Materials

GEC = BRI + ERI + CRI

#### **12.3.1.3 PKU Symptom Severity and Impacts Scale (PKU-SSIS) v2.0 – Adolescent Version**

The PKU Symptom Severity and Impact Scale (PKU-SSIS) was designed to evaluate neuropsychological symptoms and impacts in early-treated patients with PKU. The PKU-SSIS is comprised of 22 items that constitute 3 symptoms domains: 1) Emotional, Mood and Psychological; 2) (Neuro)cognitive, Executive, and Intellectual Function; 3) Physical Health. It also has 4 impact domains: 1) Social Relations; 2) Level of Independence; 3) General Wellbeing; and 4) Self-care (Quinn 2022). The instrument total score is compiled by summing the domain scores and converting to a percentage score (ie, Total score = (summed score/88)\*100). Participants will complete the PKU-SSIS as indicated in the SoA.

#### **12.3.1.4 Global Anchor Measures (Caregiver Global Impression of Severity [CaGIS], Caregiver Global Impression of Change [CaGIC], Patient Global Impression of Severity [PGIS], Patient Global Impression of Change [PGIC], and Clinician Global Impression of Change [CGIC])**

Global impression measures for severity and change (or global anchors) are standard items that have been widely used across a broad range of disease areas and are typically included in clinical trials as anchor measures to help establish meaningful change in other COAs.

Global impression of severity anchor measures (for Caregivers and Patients) rate the overall disease severity using a 5-point Likert scale from “None/Not at all impacted” to “Very severe/Very severe impact.” Global impression of change anchor measures (for Caregivers, Participants, and Clinicians) assess if there has been an improvement or change in clinical status using a 5-point Likert scale from “Much better” to “Much worse.”.

Descriptive summary will be provided for all exploratory endpoints by treatment group. ADHD-RS IV, BRIEF2, PKU-SSIS, and global anchor measures will be summarized at respective scheduled visits. Scale/domain scores and total scores for ADHD-RS IV, BRIEF2, and PKU-SSIS will be reported by timepoint. Change from baseline for ADHD-RS IV scores BRIEF2 scores and PKU-SSIS scores (by scale/domain and total scores for all three measures) will be summarized at each visit. In addition, ANCOVA models will be performed, which will include baseline measurements (when available) as covariates, randomization strata (baseline Phe  $\leq 1000$   $\mu\text{mol/L}$  or  $> 1000$   $\mu\text{mol/L}$ ) and treatment group as factors. The least square (LS) mean and 95% confidence interval will be calculated for the treatment difference between pegvaliase and diet-only arms following 72 weeks on study. In Part 2, change scores from Week 73 visit will also be summarized for participants transitioning from control to pegvaliase.

#### **12.4 Examination of Efficacy by Subgroups**

The following subgroup analysis will be performed on the primary endpoint:

- Baseline phe:  $\leq 1000$   $\mu\text{mol/L}$  or  $> 1000$   $\mu\text{mol/L}$
- Sex
- Baseline Age (12 to  $< 16$ , 16 to  $< 18$ )
- Country

## 13 SAFETY EVALUATIONS

Safety will be assessed by examining the incidence, exposure adjusted event rate, severity grade, and relationship to study drug of all treatment-emergent adverse events (TEAEs) reported during the study period. In addition, clinical laboratory results, vital signs, pregnancy test, physical exam and ECG values will be assessed. In general, two sets of safety analyses will be performed: Part 1 period and combined Part 1 and 2 periods. AE data will be summarized by the actual treatment received at the time of AE onset (pegvaliase or diet-only).

### 13.1 Adverse Events

AEs will be coded in accordance with the MedDRA (version 24.1). Only treatment-emergent adverse events (TEAEs) occurring and reported during the study period will be included in adverse event summaries. A TEAE is defined as any AE that newly appeared or worsened in severity after first dose of pegvaliase (pegvaliase arm) or on or after study day 1 (diet-only arm) until 30 days after last dose of the study.

In Part 2 participants transitioning from control to pegvaliase, a TEAE occurred during pegvaliase treatment period is defined as any AE that appeared or worsened in severity after first dose of pegvaliase until 30 days after last dose.

#### 13.1.1 All Adverse Events

The incidence and frequency of all treatment-emergent AEs will be summarized by system organ class (SOC), preferred term (PT), relationship to study drug and National Cancer Institute (NCI) Common Terminology Criteria for Adverse Events (CTCAE) severity grades. For AEs that occurred more than once during the study, the maximum severity will be used to summarize the AEs by severity.

If the onset date or end date of an adverse event is partial, the same imputation rules described in Section 2.6 will be applied.

The following summary will be performed for treatment-emergent AEs:

- All AEs by SOC and PT
- All AEs by SOC, PT and severity
- AEs assessed by investigators as related to study drug by SOC and PT
- AEs assessed by investigators as related to study drug by SOC, PT and severity
- Serious AEs (SAEs) by SOC and PT

- All AEs by PT in descending frequency order
- All AEs by SOC and PT with exposure adjusted event rate
- AEs leading to withdrawal from study by SOC and PT
- AEs leading to study drug discontinuation by SOC and PT

In addition, summary tables and listings will be provided for AEs of special interest:

- Acute systemic hypersensitivity reaction (refer to [Appendix 1](#))
- Anaphylaxis per FDA criteria (refer to [Appendix 1](#))
- Anaphylaxis per NIAID/FAAN criteria
- Angioedema per FDA criteria
- Angioedema per sponsor criteria
- Serum sickness-like reaction
- Hypersensitivity reaction (EU)
- Hypersensitivity reaction (US)
- Injection site reaction
- Injection site skin reaction  $\geq 14$  days duration
- Generalized skin reaction  $\geq 14$  days duration
- Severe injection site reaction defined as an injection site reaction that is considered CTCAE Grade  $\geq 3$
- Hypophenylalaninemia events (defined as blood Phe  $< 30$   $\mu\text{mol/L}$  on 2 consecutive measurements)
- Arthralgia that is either persistent (AE duration  $\geq 6$  months), severe (CTCAE Grade  $\geq 3$ ), or that requires treatment with a steroid (excluding topical)
- Arthralgia (sponsor-defined)
- Neuropsychiatric disorder
- Hypersensitivity AEs
- Arthralgia /Arthritis
- Lymphadenopathy  $\geq 14$  Days Duration
- Persistent Urticaria  $\geq 14$  Days Duration
- Infection and Infestations  $\geq 30$  Days Duration
- Ischemic Heart Disease

- Proteinuria/Albuminuria
- Hematuria
- Blood Creatinine Increased
- Renal Impairment
- Increased liver function test or Events Involving Hepatic Impairment
- Anemia
- Thrombocytopenia
- Hemolysis
- Myalgia
- Serositis
- Potential central nervous system vascular complications

### 13.2 Clinical Laboratory Tests

Descriptive statistics will be presented for clinical laboratory tests at each scheduled visit and for change in laboratory values from baseline. The proportion of participants who experienced at least one laboratory test result outside the normal ranges will be presented for each measurement as appropriate. Shift table from baseline to most extreme post-baseline value based on normal range and based on CTCAE grading (where available) will also be generated for each parameter as appropriate. A subject listing of laboratory test results for hematology, chemistry, urinalysis, and other laboratory tests will be provided separately. Values with CTCAE Grade  $\geq 3$  will be flagged in the listings.

A listing of laboratory test results for participants with alanine transaminase (ALT) or alanine aminotransferase (AST)  $\geq 3$ x ULN and total bilirubin  $\geq 2$ x ULN will also be provided.

### 13.3 Vital Signs

Vital signs will include systolic blood pressure (SBP) and diastolic blood pressure (DBP) measured in millimeters of mercury (mm Hg), heart rate in beats per minute, respiration rate in breaths per minute, and temperature in degrees Celsius (°C).

Summary statistics including n, mean, SD, median, minimum, and maximum will be provided for these parameters at each visit. A subject listing will also be provided.

**13.4 12-lead Electrocardiogram**

The frequency of abnormalities and clinically significant abnormalities in 12-lead electrocardiogram will be summarized at each visit. A subject listing of ECG findings will be provided.

**13.5 Physical Examination**

Physical examinations will include assessments of general appearance; head, eyes, ears, nose, and throat; the cardiovascular, dermatologic, lymphatic, respiratory, gastrointestinal, musculoskeletal, and neurologic systems. Other body systems may be examined if needed. A subject listing for clinically significant findings at each visit will be provided.

**13.6 Pregnancy Test**

A subject listing for pregnancy urine sample test at each visit will be provided.

## 14 IMMUNOGENICITY TESTS

Immunogenicity will be performed using validated immunogenicity assays. Immunogenicity assays include total anti-pegvaliase antibodies (TAb), anti-PAL IgG, anti-PAL IgM, anti-PEG IgM, anti-PEG IgG, and neutralizing antibodies (NAb). In the event of a Hypersensitivity Reaction visit (HRV), anti-pegvaliase IgE will be assessed.

For immunogenicity analysis, incidence tables and titer summary statistics including mean, median, standard deviation, and minimum/maximum titer values at each study visit will be provided for each antibody analyte.

Anti-drug antibody impact on safety will be evaluated. Plots and tables will be generated to explore the potential impact of anti-drug antibodies on Hypersensitivity Reaction (US and EU) frequency and severity. A listing will be provided for each subject who has Hypersensitivity Reaction Visit.

Anti-drug antibody impact on efficacy will also be evaluated. Plots and tables may be generated to explore the potential impact of anti-drug antibodies on blood Phe levels.

## 15 APPENDICES

### Appendix 1: Search Strategies for Adverse Event of Special Interest, and Sponsor Defined AEs of Clinical Significance

MedDRA version: most current version at program termination

#### 1. Anaphylaxis per NIAID/FAAN criteria

Anaphylaxis per NIAID/FAAN is defined using the NIAID/FAAN clinical diagnostic criteria through review on the potential anaphylaxis per NIAID/FAAN cases, which are identified using Broad algorithmic anaphylactic reaction SMQ with the below algorithm:

Algorithm = A or (B and C) or (D and (B or C))

| Name of Search                              | Category | Preferred Term                    |
|---------------------------------------------|----------|-----------------------------------|
| Broad Algorithmic Anaphylactic Reaction SMQ | A        | Anaphylactic reaction             |
|                                             | A        | Anaphylactic shock                |
|                                             | A        | Anaphylactic transfusion reaction |
|                                             | A        | Anaphylactoid reaction            |
|                                             | A        | Anaphylactoid shock               |
|                                             | A        | Circulatory collapse              |
|                                             | A        | Dialysis membrane reaction        |
|                                             | A        | Kounis syndrome                   |
|                                             | A        | Procedural shock                  |
|                                             | A        | Shock                             |
|                                             | A        | Shock symptom                     |
|                                             | A        | Type I hypersensitivity           |
|                                             | B        | Acute respiratory failure         |
|                                             | B        | Asthma                            |
|                                             | B        | Bronchial oedema                  |
|                                             | B        | Bronchospasm                      |
|                                             | B        | Cardio-respiratory distress       |
|                                             | B        | Chest discomfort                  |
|                                             | B        | Choking                           |
|                                             | B        | Choking sensation                 |
|                                             | B        | Circumoral oedema                 |
|                                             | B        | Cough                             |
|                                             | B        | Cough variant asthma              |

| Name of Search | Category | Preferred Term                                  |
|----------------|----------|-------------------------------------------------|
|                | B        | Cyanosis                                        |

## 2. Anaphylaxis per FDA criteria

Anaphylaxis events defined according to the Division of Pulmonary, Allergy, and Rheumatology Products (DPARP) methodology are referred to as “anaphylaxis per FDA criteria”. The FDA’s assessment methodology includes individual case safety reports with any of the following characteristics:

- Clinical manifestations consistent with National Institute of Allergy and Infectious Disease/Food Allergy and Anaphylaxis Network (NIAID/FAAN) Criterion #1 (skin involvement + respiratory or cardiovascular compromise); or
- Verbatim reports of anaphylaxis/anaphylactic reaction (or synonyms), even if NIAID/FAAN criteria were not met; or
- Cases involving subject injection of epinephrine alone, even if subject did not experience signs/symptoms necessary to meet NIAID/FAAN criteria.

## 3. Acute systemic hypersensitivity reaction

An acute systemic hypersensitivity reaction (referred to as anaphylaxis in the protocol) is defined as an episode meeting National Institute of Allergy and Infectious Disease/Food Allergy and Anaphylaxis Network (NIAID/FAAN) criteria according to an internal BioMarin assessment performed by the Internal Data Safety Review Board. The acute systemic hypersensitivity reaction events will also be presented if they meet Brown’s severe criteria as determined by the Internal Safety Review Board.

## 4. Angioedema per FDA criteria

Angioedema as an AE reported as any PT in the MedDRA Angioedema Higher Level Term excluding idiopathic angioedema, Gleich’s syndrome, and hereditary angioedema; and also excluding any AE which is part of an Anaphylaxis per FDA criteria episode.

## 5. Angioedema per sponsor criteria

A 2-step process to identify angioedema per sponsor criteria, the following assessment was performed on the entire AE dataset:

- Step 1: all reported ADRs suggestive of angioedema using the Angioedema MedDRA HLT search, which includes the following 21 PTs: angioedema, circumoral oedema, eyelid oedema, face oedema, Gleich’s syndrome, hereditary

angioedema, idiopathic angioedema, intestinal angioedema, laryngeal oedema, laryngotracheal oedema, lip oedema, lip swelling, mouth swelling, oculorespiratory syndrome, oedema mouth, oropharyngeal swelling, periorbital oedema, pharyngeal oedema, swelling face, swollen tongue, and tongue oedema.

- Step 2: BioMarin then clinically assessed the retrieved data identified from Step 1 to assign concurrent events into episodes and to exclude:
  - False positive ADR reports that have clear confounders which impact assessment, e.g., onset of event(s)  $\geq 30$  days after last dose or events/episodes with a very clear alternative etiology, such as throat swelling secondary to intubation). Cases were not excluded where the events have a long duration which may be atypical for angioedema, or where events occurred concurrent with other conditions which may have contributed to their development (e.g., eye swelling reported during episode(s) of seasonal allergy).
- Episodes which occurred as part of an acute systemic hypersensitivity reaction and, therefore, will already be included in the incidence for acute systemic hypersensitivity reactions (to avoid duplication).

In the sponsor's opinion, the methodology described above is more likely to be reflective of the true incidence of angioedema manifestations.

#### **6. Serum Sickness-like reaction**

Serum sickness-like reaction will be defined by including all preferred term of serum sickness, serum sickness-like reactions and Type III immune complex mediated reactions.

#### **7. Hypersensitivity Reaction (EU)**

Hypersensitivity reactions are defined as the modified hypersensitivity SMQ (narrow SMQ) or an anaphylaxis event as described in **Error! Reference source not found.** - Listing 1 and adjudicated as per the Acute Systemic Hypersensitivity Reaction in section 10.5.2 in Protocol

The following terms should be excluded from the Modified Hypersensitivity (Narrow SMQ) search criteria:

injection site rash

injection site urticaria

## 8. Hypersensitivity Reaction (US)

Hypersensitivity reaction is defined as the modified hypersensitivity SMQ (narrow SMQ), plus the anaphylaxis adjudicated by FDA criteria.

The following terms should be excluded from the Modified Hypersensitivity (Narrow SMQ) search criteria:

injection site rash

injection site urticaria

anaphylactic reaction

anaphylactoid reaction

## 9. Injection site reaction

Injection-site reaction will be identified using injection site reaction Higher Level MedDRA term.

## 10. Severe Injection-site reaction

Severe injection site reaction will be identified as any injection site reaction report that is reported as Common Terminology Criteria for Adverse Events (CTCAE) Grade 3 or above in severity and meeting MedDRA high level term (HLT) for Injection site reaction.

## 11. Injection site skin reaction $\geq$ 14 days duration

Injection site skin reaction with  $\geq$  14 days duration will be identified by preferred term search using the list below. To be included as injection site skin reaction, the duration of the event needs to be  $\geq$  14 days (Multiple AE records with same preferred term and  $\leq$  1 day difference between the start date and end date and with severity worsens are considered as same event).

| Name of Search               | Preferred Term                     |
|------------------------------|------------------------------------|
| Injection site skin reaction | Injection site anaesthesia         |

## 12. Generalized skin reaction $\geq 14$ days duration

Generalized skin reaction  $\geq 14$  days duration will be identified in following ways:

- Preferred term search using below listing, or
- Broad vasculitis SMQ

To be included as generalized skin reaction, the duration of the event needs to be  $\geq 14$  days (Multiple AE records with same preferred term and  $\leq 1$  day difference between the start date and end date and with severity worsens are considered as same event).

| Name of Search            | Preferred Term                             |
|---------------------------|--------------------------------------------|
| Generalized Skin Reaction | Acute cutaneous lupus erythematosus        |
|                           | Acute febrile neutrophilic dermatosis      |
|                           | Acute generalised exanthematous pustulosis |

### 13. Arthralgia (sponsor defined)

Arthralgia combines preferred term of arthralgia, pain in extremity, back pain, musculoskeletal pain, neck pain.

### 14. Arthralgia (steroid treated)

To identify the events of arthralgia that were treated with steroids (excluding topicals), the following steps are required.

- Identify the events of arthralgia (Arthralgia combines the preferred terms: of arthralgia, pain in extremity, back pain, musculoskeletal pain, neck pain), and Identify those arthralgia AEs that were treated with a concomitant medication after the onset date of the start of the arthralgia AE and before the resolution date of the arthralgia AE; and

- The resultant file will be clinically reviewed by BioMarin to identify the arthralgia events that were treated with a concomitant steroid (excluding those events that were administered topically, or where the steroid medication was used during an arthralgia episode but for an indication other than arthralgia).

### 15. Severe or Persistent ( $\geq 6$ months) arthralgia

Arthralgia will be identified as the preferred terms of arthralgia, pain in extremity, back pain, musculoskeletal pain, and neck pain. Persistent arthralgia is defined as any arthralgia event that has a duration of the event  $\geq 6$  months (Multiple AE records with same reported term and  $\leq 1$  day difference between the start date and end date are considered as same event). Severe arthralgia is defined as any arthralgia event that is reported as CTCAE Grade 3 or above in severity.

### 16. Hypophenylalaninemia

Hypophenylalaninemia is defined as a blood phenylalanine (Phe) level  $\leq 30$   $\mu\text{mol/L}$  for a minimum of 2 consecutive values, with the start of the event defined as the first blood Phe assessment day with  $< 30$   $\mu\text{mol/L}$  and the end of the event defined as the day prior to the first blood Phe assessment  $\geq 30$   $\mu\text{mol/L}$ .

### 17: Neuropsychiatric disorder

A neuropsychiatric disorder is defined as Psychiatric disorder SOC + modified Nervous system SOC.

| Name of Search       | Preferred Term                 |
|----------------------|--------------------------------|
| Modified nervous SOC | Acalculia                      |
|                      | Agitation postoperative        |
|                      | Agnosia                        |
|                      | Agraphia                       |
|                      | AIDS dementia complex          |
|                      | Akathisia                      |
|                      | Altered state of consciousness |
|                      | Amnesia                        |
|                      | Amnestic disorder              |
|                      | Anosognosia                    |
|                      | Anterograde amnesia            |
|                      | Aphasia                        |
|                      | Apraxia                        |

|                                  |
|----------------------------------|
| Aura                             |
| Autism                           |
| Borderline mental impairment     |
| Circadian rhythm sleep disorder  |
| Clumsiness                       |
| Cognitive disorder               |
| Coprolalia                       |
| Crying                           |
| Decreased eye contact            |
| Delayed sleep phase              |
| Dementia                         |
| Depressed level of consciousness |
| Disorganised speech              |
| Disorientation                   |
| Disturbance in attention         |
| Dreamy state                     |
| Dysphemia                        |
| Dysphonia psychogenic            |
| Dyssomnia                        |
| Echolalia                        |
| Fine motor skill dysfunction     |
| Formication                      |
| Fumbling                         |
| Hyperkinesia                     |
| Hypersomnia                      |
| Hypokinesia                      |
| Hyporesponsive to stimuli        |
| Hyposomnia                       |
| Incoherent                       |
| Initial insomnia                 |
| Insomnia                         |
| Intelligence increased           |
| Irregular sleep phase            |
| Judgement impaired               |
| Lethargy                         |
| Memory impairment                |

|  |                                |
|--|--------------------------------|
|  | Mental impairment              |
|  | Mental retardation             |
|  | Mild mental retardation        |
|  | Moderate mental retardation    |
|  | Mutism                         |
|  | Neurological decompensation    |
|  | Neurological symptom           |
|  | Parosmia                       |
|  | Phantom pain                   |
|  | Poor quality sleep             |
|  | Posturing                      |
|  | Presenile dementia             |
|  | Profound mental retardation    |
|  | Psychomotor hyperactivity      |
|  | Psychomotor skills impaired    |
|  | Repetitive speech              |
|  | Restlessness                   |
|  | Sedation                       |
|  | Senile dementia                |
|  | Sleep phase rhythm disturbance |
|  | Slow response to stimuli       |
|  | Slow speech                    |
|  | Somnolence                     |
|  | Speech disorder                |
|  | Stereotypy                     |
|  | Stupor                         |
|  | Sudden onset of sleep          |
|  | Symbolic dysfunction           |
|  | Unresponsive to stimuli        |
|  | Verbigeration                  |

**18: Hypersensitivity AEs**

Hypersensitivity AEs will be identified in two ways:

- Broad Algorithmic anaphylactic reaction Standardized MedDRA Queries (SMQ) with the below algorithm:

Algorithm = A or (B and C) or (D and (B or C))

- Modified Hypersensitivity SMQ to include below additional preferred terms

| Name of Search                                               | Preferred Term   |
|--------------------------------------------------------------|------------------|
| Additional preferred terms for Modified Hypersensitivity SMQ | Arthralgia       |
|                                                              | Arthritis        |
|                                                              | Eye inflammation |
|                                                              | Eye irritation   |
|                                                              | Eye pain         |
|                                                              | Joint stiffness  |
|                                                              | Joint swelling   |
|                                                              | Pyrexia          |
|                                                              | Vision blurred   |
|                                                              | Polyarthritis    |

**19: Arthralgia /Arthritis:**

Arthralgia combines preferred term of arthralgia, Joint crepitation, Joint effusion, Joint destruction, Joint noise, Joint swelling, Joint stiffness.

Arthritis was identified using following preferred terms:

| Name of Search | Preferred Term                                                    |
|----------------|-------------------------------------------------------------------|
| Arthritis      | Amyloid arthropathy                                               |
|                | Antithyroid arthritis syndrome                                    |
|                | Arthritis                                                         |
|                | Arthritis allergic                                                |
|                | Arthritis climacteric                                             |
|                | Arthritis enteropathic                                            |
|                | Arthritis reactive                                                |
|                | Arthropathy                                                       |
|                | Arthrotoxicity                                                    |
|                | Autoimmune arthritis                                              |
|                | Behcet's syndrome                                                 |
|                | Blau syndrome                                                     |
|                | Carcinomatous polyarthritis                                       |
|                | Diabetic arthropathy                                              |
|                | Haemarthrosis                                                     |
|                | Haemophilic arthropathy                                           |
|                | Hyper IgD syndrome                                                |
|                | Injection site joint inflammation                                 |
|                | Monarthritis                                                      |
|                | Multicentric reticulohistiocytosis                                |
|                | Neuropathic arthropathy                                           |
|                | Palindromic rheumatism                                            |
|                | Polyarthritis                                                     |
|                | Poncet's disease                                                  |
|                | Pyogenic sterile arthritis pyoderma gangrenosum and acne syndrome |
|                | Reiter's syndrome                                                 |
|                | Rheumatic fever                                                   |
|                | Sacroiliitis                                                      |
|                | Seronegative arthritis                                            |
|                | SLE arthritis                                                     |
|                | Sympathetic posterior cervical syndrome                           |
|                | Traumatic arthritis                                               |
|                | Traumatic arthropathy                                             |

**20: Lymphadenopathy ≥ 14 Days Duration**

Lymphadenopathy will be identified from preferred terms outlined below. To be included in the results, the duration of the event should be  $\geq 14$  days (Multiple AE records with same preferred term and  $\leq 1$  day difference between the start date and end date and with severity worsens are considered as same event).

| Name of Search  | Preferred Term                         |
|-----------------|----------------------------------------|
| Lymphadenopathy | Abdominal lymphadenopathy              |
|                 | Hilar lymphadenopathy                  |
|                 | Injection site lymphadenopathy         |
|                 | Lymph node calcification               |
|                 | Lymph node fibrosis                    |
|                 | Lymph node pain                        |
|                 | Lymphadenitis                          |
|                 | Lymphadenocyst                         |
|                 | Lymphadenopathy                        |
|                 | Lymphadenopathy mediastinal            |
|                 | Lymphatic disorder                     |
|                 | Lymphoid tissue hyperplasia            |
|                 | Paratracheal lymphadenopathy           |
|                 | Persistent generalised lymphadenopathy |
|                 | Retroperitoneal lymphadenopathy        |
|                 | Spleen disorder                        |
|                 | Splenomegaly                           |
|                 | lymph node palpable                    |

**21: Persistent Urticaria ≥ 14 Days Duration**

Persistent urticaria will be identified using preferred term: urticaria, with event duration  $\geq 14$  days (Multiple AE records with same reported term and  $\leq 1$  day difference between the start date and end date and with severity worsens were considered as same event).

**22: Infection and Infestations ≥ 30 Days Duration**

Infection and Infestations will be identified using Infection and Infestations SOC. To be included in the result, the duration of the event should be  $\geq 30$  days (Multiple AE records with same reported term and  $\leq 1$  day difference between the start date and end date and with severity worsens were considered as same event).

### 23: Ischemic Heart Disease

Ischemic heart disease will be identified using myocardial infarction narrow SMQ + Other Ischemic heart disease SMQ

### 24: Proteinuria/Albuminuria

Proteinuria/Albuminuria will be identified using the modified Proteinuria SMQ (narrowed SMQ adding a couple of the terms from the broad SMQ).

| Name of Search          | Preferred Term                           |
|-------------------------|------------------------------------------|
| Proteinuria/Albuminuria | Albumin globulin ratio increased         |
|                         | Albumin urine present                    |
|                         | Albuminuria                              |
|                         | Bence Jones protein urine present        |
|                         | Bence Jones proteinuria                  |
|                         | Beta 2 microglobulin urine increased     |
|                         | Globulinuria                             |
|                         | Microalbuminuria                         |
|                         | Myoglobinuria                            |
|                         | Orthostatic proteinuria                  |
|                         | Protein urine                            |
|                         | Protein urine present                    |
|                         | Proteinuria                              |
|                         | Urine albumin/creatinine ratio abnormal  |
|                         | Urine albumin/creatinine ratio increased |
|                         | Urine protein/creatinine ratio abnormal  |
|                         | Urine protein/creatinine ratio increased |
|                         | Aminoaciduria                            |
|                         | Haemoglobinuria                          |

### 25: Hematuria

Hematuria was identified using following preferred terms:

| Name of Search | Preferred Term                 |
|----------------|--------------------------------|
| Hematuria      | Haematuria                     |
|                | Haemoglobin urine present      |
|                | Haemoglobin urine              |
|                | Haemoglobinuria                |
|                | Red blood cells urine positive |
|                | Red blood cells urine          |
|                | Blood urine present            |
|                | Blood urine                    |

## 26: Blood Creatinine Increased

Blood creatinine increased will be identified using the following preferred terms: Blood creatinine abnormal, blood creatinine increased.

## 27: Renal Impairment

Renal impairment will be identified using a combination of modified narrow tubulointerstitial diseases SMQ, modified narrow acute renal failure SMQ, and modified narrow chronic kidney disease SMQ.

| Name of Search                                    | Preferred Term                            |
|---------------------------------------------------|-------------------------------------------|
| Modified narrow tubulointerstitial diseases (SMQ) | Acidosis hyperchloraemic                  |
|                                                   | Acquired aminoaciduria                    |
|                                                   | Acute phosphate nephropathy               |
|                                                   | Aminoaciduria                             |
|                                                   | Beta-N-acetyl-D-glucosaminidase increased |
|                                                   | Crystal nephropathy                       |
|                                                   | Eosinophils urine present                 |
|                                                   | Fanconi syndrome acquired                 |
|                                                   | Hyperphosphaturia                         |
|                                                   | Isosthenuria                              |
|                                                   | Nephritis allergic                        |
|                                                   | Nephrogenic diabetes insipidus            |
|                                                   | Nephropathy toxic                         |
|                                                   | Renal glycosuria                          |
|                                                   | Renal papillary necrosis                  |
|                                                   | Renal tubular acidosis                    |

|  |                                                   |
|--|---------------------------------------------------|
|  | Renal tubular atrophy                             |
|  | Renal tubular disorder                            |
|  | Tubulointerstitial nephritis                      |
|  | Tubulointerstitial nephritis and uveitis syndrome |
|  | Urine phosphorus increased                        |
|  | Urine retinol binding protein increased           |
|  | Albumin urine present                             |
|  | Albuminuria                                       |
|  | Cylindruria                                       |
|  | Haematuria                                        |
|  | Haemoglobin urine present                         |
|  | Haemoglobinuria                                   |
|  | Microalbuminuria                                  |
|  | Protein urine present                             |
|  | Proteinuria                                       |
|  | Red blood cells urine positive                    |
|  | Renal tubular necrosis                            |
|  | Sterile pyuria                                    |

| Name of Search                            | Preferred Term                |
|-------------------------------------------|-------------------------------|
| Modified narrow acute renal failure (SMQ) | Acute kidney injury           |
|                                           | Acute phosphate nephropathy   |

|  | Urine protein/creatinine ratio increased |

### 28: Increased liver function test or Events Involving Hepatic Impairment

Increased liver function test (LFT) or events involving hepatic impairment will be identified using modified hepatocellular damage and hepatitis NEC HLT plus broad Liver related investigations, signs and symptoms SMQ.

Additional preferred terms for modified hepatocellular damage and hepatitis NEC HLT:

| Name of Search                                                                      | Preferred Term                   |
|-------------------------------------------------------------------------------------|----------------------------------|
| Additional preferred terms for modified hepatocellular damage and hepatitis NEC HLT | Autoimmune hepatitis             |
|                                                                                     | Allergic hepatitis               |
|                                                                                     | Chronic hepatitis                |
|                                                                                     | Drug-induced liver injury        |
|                                                                                     | Hepatitis                        |
|                                                                                     | Hepatitis acute                  |
|                                                                                     | Hepatitis fulminant              |
|                                                                                     | Hepatitis toxic                  |
|                                                                                     | Hepatocellular injury            |
|                                                                                     | Hepatotoxicity                   |
|                                                                                     | Liver injury                     |
|                                                                                     | Non-alcoholic fatty liver        |
|                                                                                     | Non-alcoholic steatohepatitis    |
|                                                                                     | Nonalcoholic fatty liver disease |
|                                                                                     | Steatohepatitis                  |

| Name of Search                                         | Preferred Term                                |
|--------------------------------------------------------|-----------------------------------------------|
| Liver related investigations, signs and symptoms (SMQ) | Alanine aminotransferase abnormal             |
|                                                        | Alanine aminotransferase increased            |
|                                                        | Ammonia abnormal                              |
|                                                        | Ammonia increased                             |
|                                                        | Ascites                                       |

| Peritoneal fluid protein abnormal                          |
| Peritoneal fluid protein decreased                         |
| Peritoneal fluid protein increased                         |
| Pneumobilia                                                |

|  |                                   |
|--|-----------------------------------|
|  | Portal vein flow decreased        |
|  | Portal vein pressure increased    |
|  | Retinol binding protein decreased |
|  | Urobilinogen urine decreased      |
|  | Urobilinogen urine increased      |

**29: Anemia**

Anemia will be identified using following preferred terms:

| Name of Search | Preferred Term        |
|----------------|-----------------------|
| Anemia         | Anaemia               |
|                | Anaemia macrocytic    |
|                | Anaemia megaloblastic |
|                | Hyperchromic anaemia  |
|                | Hypochromic anaemia   |
|                | Microcytic anaemia    |
|                | Sideroblastic anaemia |

**30: Thrombocytopenia**

Thrombocytopenia will be identified using following preferred terms:

| Name of Search   | Preferred Term                  |
|------------------|---------------------------------|
| Thrombocytopenia | Thrombocytopenia                |
|                  | Immune thrombocytopenic purpura |
|                  | Platelet production decreased   |
|                  | Thrombocytopenic purpura        |
|                  | Platelet count decreased        |
|                  | Platelet count abnormal         |
|                  | Platelet destruction increased  |
|                  | Platelet disorder               |
|                  | Platecrit abnormal              |
|                  | Platecrit decreased             |
|                  |                                 |

**31: Hemolysis**

Hemolysis will be identified using broad haemolytic disorders SMQ.

| Name of Search | Preferred Term                    |
|----------------|-----------------------------------|
| Hemolysis      | ABO haemolytic disease of newborn |
|                | ABO incompatibility               |

|  |                                                     |
|--|-----------------------------------------------------|
|  | Acid haemolysin test positive                       |
|  | Acute haemolytic transfusion reaction               |
|  | Alloimmunisation                                    |
|  | Anti A antibody positive                            |
|  | Anti B antibody positive                            |
|  | Anti-erythrocyte antibody positive                  |
|  | Autoimmune haemolytic anaemia                       |
|  | Blood incompatibility haemolytic anaemia of newborn |
|  | Cardiac haemolytic anaemia                          |
|  | Cold agglutinins positive                           |
|  | Cold type haemolytic anaemia                        |
|  | Coombs direct test positive                         |
|  | Coombs indirect test positive                       |
|  | Coombs negative haemolytic anaemia                  |
|  | Coombs positive haemolytic anaemia                  |
|  | Coombs test positive                                |
|  | Delayed haemolytic transfusion reaction             |
|  | Erythroblastosis                                    |
|  | Erythroblastosis foetalis                           |
|  | Evans syndrome                                      |
|  | Extravascular haemolysis                            |
|  | Glucose-6-phosphate dehydrogenase abnormal          |
|  | Glucose-6-phosphate dehydrogenase deficiency        |
|  | Haemoglobin urine present                           |
|  | Haemoglobinaemia                                    |
|  | Haemoglobinuria                                     |
|  | Haemolysis                                          |
|  | Haemolysis neonatal                                 |
|  | Haemolytic anaemia                                  |
|  | Haemolytic transfusion reaction                     |
|  | Haemolytic uraemic syndrome                         |
|  | Haemosiderinuria                                    |
|  | Haptoglobin decreased                               |
|  | Intravascular haemolysis                            |
|  | Isoimmune haemolytic disease                        |
|  | Jaundice acholuric                                  |
|  | Microangiopathic haemolytic anaemia                 |

|  |                                      |
|--|--------------------------------------|
|  | Paroxysmal nocturnal haemoglobinuria |
|  | Passenger lymphocyte syndrome        |
|  | Red cell fragmentation syndrome      |
|  | Rhesus antibodies positive           |
|  | Rhesus haemolytic disease of newborn |
|  | Rhesus incompatibility               |
|  | Transfusion reaction                 |
|  | Warm type haemolytic anaemia         |
|  | Reticulocyte count abnormal          |
|  | Reticulocyte count increased         |
|  | Reticulocyte percentage abnormal     |
|  | Reticulocyte percentage increased    |
|  | Reticulocytosis                      |

**32: Myalgia**

Myalgia will be identified using the following PT: Fibromyalgia, Myalgia, Myalgia intercostal, Myofascial pain syndrome, Neuromuscular pain

**33: Serositis**

Serositis will be identified using following preferred terms:

| Name of Search | Preferred Term            |
|----------------|---------------------------|
| Serositis      | Pericardial effusion      |
|                | Pericardial rub           |
|                | Pericarditis              |
|                | Pleural effusion          |
|                | Pleural rub               |
|                | Pleurisy                  |
|                | Pleuropericarditis        |
|                | Polyserositis             |
|                | Serositis                 |
|                | Peritonitis               |
|                | Noninfectious peritonitis |
|                | Ascites                   |
|                | Lymphocele                |
|                | Chylothorax               |

**34: Potential central nervous system vascular complications**

Potential central nervous system (CNS) vascular complications will be identified using ischaemic central nervous system vascular conditions (SMQ).

### 3 INTRODUCTION

Study 165-306 is an open-label, two-arm (Active vs Diet-only Control), randomized control study to evaluate safety and efficacy of pegvaliase and characterize the PK of pegvaliase in adolescent participants with phenylketonuria (PKU).

The purpose of this Statistical Analysis Plan (SAP) is to provide a comprehensive description of methods of the data analyses outlined in the protocol (amendment 2 dated 23 October 2023).

If discrepancies exist between the text of the statistical analysis as planned in the protocol and the final SAP, the SAP will prevail. The discrepancies will be documented in the clinical study report (CSR).

#### 3.1 Objectives of Study

The primary objective of the study is:

- To evaluate the efficacy of pegvaliase in adolescent participants with PKU
- To evaluate the safety of pegvaliase in adolescent participants with PKU

The secondary objectives of the study are:

- To characterize total dietary protein intake in adolescent participants with PKU after pegvaliase treatment
- To characterize the pharmacokinetics (PK) of pegvaliase in adolescent participants with PKU

The exploratory objectives of the study are:

- To evaluate the effect of pegvaliase treatment on neurocognitive outcomes in adolescent participants with PKU
- To assess changes in PKU symptoms and impacts
- To compare participants' optimal maintenance pegvaliase dose across different age groups within the study
- Explore the biochemical, molecular, and cellular aspects of PKU
- PAH genotyping

#### 3.2 Study Design

This is an open-label, two arm, randomized controlled study. Approximately 54 US and EU participants (ages 12 to 17 years old (US), inclusive, and 12 to 15 years old (EU), inclusive) with diet-only control will be enrolled. At enrollment, participants will be randomized 2:1 to the active (pegvaliase) and control (diet-only) treatment arms, with approximately 36 participants receiving daily pegvaliase and 18 participants managing PKU by diet alone. Treatment assignment will be stratified by Screening/Run-in blood Phe (mean of the 2 pre-

treatment blood Phe assessments performed during the Screening/Run-in period) of  $\leq 1000 \mu\text{mol/L}$  or  $> 1000 \mu\text{mol/L}$ . Participants in the active and control arms will follow the same visit schedules and perform the same assessments throughout the 72-week Primary Treatment Phase (Part 1) except that the control participants will not be receiving pegvaliase so will not have PK draws or immunogenicity assessments.

After providing informed consent, participants will enter the Screening/Run-in period, which will last 4 weeks and include 2 assessments of blood Phe levels, 7 to 10 days apart, to determine eligibility. Following confirmation that the 2 blood Phe results are  $> 600 \mu\text{mol/L}$  and all other eligibility criteria have been met, participants may be enrolled in the study on Day 1. During the Screening/Run-in and the Primary Treatment Phase (Part 1), participants will be required to maintain stable protein intake from both medical food and/or intact food.

The duration of Part 1 is 72 weeks, during which pegvaliase treatment will be initiated for participants in the active arm using an Induction/Titration/Maintenance (I/T/M) dosing regimen. The I/T/M dosing regimen consists of an Induction/Titration Dosing (9 weeks) and a Maintenance Dosing. Required hospital setting visits during Part 1 will occur for all dosing visits for the first 8 weeks, every 4 weeks thereafter, and when the pegvaliase dose is escalated to 20, 40 or 60 mg/day. The assessments performed at the clinic visits include measurement of blood Phe, neurocognitive assessments, PK blood draws (active participants only), and safety assessments.

Beginning Week 73, participants in the active treatment arm will continue to receive pegvaliase in the Extension Phase (Part 2) for up to 142 additional weeks (through Week 215). Beginning Week 73, participants in the control treatment arm will initiate pegvaliase treatment and, from Weeks 73 through 215, will follow the same schedule for dosing, study visits, and assessments that the active arm participants followed for pegvaliase dosing starting from Study Day 1.

### 3.3 Study Population

Individuals with PKU aged 12 to 17 years old (US), inclusive, and 12 to 15 years old (EU), inclusive with diet-only control at the start of the Screening/Run-in Period (Day -28) are candidates for participation in the study. Additional criteria for study participation are presented in Protocol 165-306 Section 5.1 and Section 5.2.

### 3.4 Study Dosage and Administration

Participants will receive pegvaliase at a concentration of 5.0 or 20.0 mg/mL. Pegvaliase will be administered subcutaneously at dose levels in the range of 2.5 to 60 mg. The minimum

dose of pegvaliase is 2.5 mg/week. The maximum allowable daily dose of pegvaliase is 60 mg/day (for a maximum weekly total dose of 420 mg).

### 3.5 Sample Size Determination

Approximately 54 participants will be enrolled and randomized to the pegvaliase or diet-only groups in 2:1 ratio. Assuming a mean (SD) reduction in Phe following 72 weeks on study is 640 (570)  $\mu\text{mol/L}$  in the pegvaliase group and 100 (250)  $\mu\text{mol/L}$  in the diet-only group, a total sample size of 54 participants will provide more than 90% power to detect a treatment difference, based on the two-sample T-test with unequal variance and a significance level of 0.05 (two sided).

Approximately 72 participants will be screened for study participation such that approximately 54 participants will be enrolled in the study.

For the pegvaliase treatment arm, the mean (SD) assumption of reduction in blood Phe is based on participants 16 to 24 years of age who completed 17 months of treatment in previous pegvaliase studies utilizing an I/T/M dosing regimen ( $n = 46$ ). For the diet-only arm, the mean (SD) assumption of reduction in blood Phe is based on BioMarin's PKUDOS (Phenylketonuria Demographic, Outcomes, and Safety) registry for patients aged 12 to <18 years old on diet only control with baseline Phe > 600  $\mu\text{mol/L}$  at year 1 of study enrollment ( $n = 57$ ).

### 3.6 Blinding and Randomization Methods

#### 3.6.1 Blinding Method

Participants will receive open-label pegvaliase or diet-only treatment.

#### 3.6.2 Randomization Method

Participants will be randomized in a 2:1 ratio to the active (pegvaliase) or control (diet-only) treatment arm, respectively. Treatment assignment will be stratified by Screening/Run-In blood Phe (mean of the 2 pre-treatment blood Phe assessments performed during the Screening/Run-in period) of  $\leq 1000 \mu\text{mol/L}$  or  $> 1000 \mu\text{mol/L}$ .

### 3.7 Interim Analysis

There are no interim analyses planned. The primary analysis will be performed after all participants complete Part 1 or discontinued from the study. The final analyses will be performed after all participants have completed the study or discontinued from the study.

## 4 GENERAL ANALYSIS CONSIDERATION

Descriptive summaries of continuous variables will include n, mean, standard deviation (SD), median, minimum, and maximum. Descriptive summaries of categorical variables will include n, frequency, and percentage.

### 4.1 Analysis Populations

The All Enrolled population will consist of all participants who agree to participate in the clinical study (by their parent/guardians, if applicable) following completion of the informed consent process and determination of study eligibility.

The Intent to Treat (ITT) population will consist of all participants who are randomized. Participants will be analyzed according to the randomized treatment for the analysis of efficacy.

The Safety population will consist of all participants who received at least one dose of study treatment (pegvaliase or diet-only management of PKU). Subjects will be analyzed according to the treatment actually received for the analysis of safety.

The Per Protocol (PP) population will consist of all participants in the ITT population who are compliant with the protocol with no important protocol deviations impacting the primary efficacy analysis. The PP population will be determined by the study team through data review before database snapshot for primary analysis; reasons for excluding participants will be defined and documented prior to database snapshot for primary analysis.

The PK population will consist of all participants who received pegvaliase with at least one PK measurement.

### 4.2 Treatment Group Presentation

The following treatment groups will be used in summary tables:

Part 1: pegvaliase (active) or diet-only (control)

Part 2: pegvaliase (participants continuing on pegvaliase) or diet-only (participants transitioning from control to pegvaliase)

### 4.3 Pooling of Data from Sites with Small Enrollment

Since the enrollment for each site is expected to be small, the analyses will not be performed by site or pooled sites.

#### 4.4 Study Day Derivation

Study days will be derived as follows:

Pegvaliase arm: the first dose date will be assigned as Study Day 1

Diet only arm: the Visit 1 date will be assigned as Study Day 1

For visit occurs on or after Study Day 1, Study Day = visit date – day 1 date + 1

For visit occurs before Study Day 1, Study Day = visit date – day 1 date. There is no Study Day 0.

##### 4.4.1 Baseline Definition

The baseline for all safety and efficacy endpoints (when applicable) is defined as the last non-missing measurement collected prior to the first pegvaliase dose (pegvaliase arm) or prior to or on Visit 1 date (diet-only arm), unless otherwise specified:

Baseline blood Phe concentration at Part 1 is defined as the average of 3 pre-treatment measurements collected between screening/Run-in (2) and Day 1 pre-dose (1). Baseline blood Phe concentration at Part 2 is defined as the average of week 69 and week 73 measurements.

Baseline total protein intake at Part 1 is defined as the mean total dietary protein intake calculated from the 3 separate 3-day diet diaries collected during Screening/Run-in (2) and Day 1 (1). Baseline total protein intake at Part 2 is defined as the average of week 69 and week 73 measurements

For other measurements,

- Pegvaliase:
  - Baseline for the whole study period: last non-missing measurement prior to first pegvaliase dose
- Diet only:
  - Baseline for Part 1: last non-missing measurement prior to visit day 1
  - Baseline for Part 2: measurements taken prior to first dose of pegvaliase at Week 73

##### 4.4.2 Treatment Period and Phase

Pegvaliase treatment period is defined from study Day 1 until 30 days after last dose.

Definitions of Induction, titration and maintenance phase during pegvaliase treatment period are as follows:

**Induction:** When subjects are on a 2.5 mg weekly dose.

**Titration:** When subjects have completed the induction phase and begin to increase dose and dosing frequency until they meet the criterion for the Maintenance Phase.

**Induction/Titration:** The treatment period prior to the start of Maintenance Phase.

**Maintenance (first occurrence):**

- US: Completion of an 8-week period with at least 80% compliance at the same dose. The start of maintenance phase is at the end of the 8-week period.
- EU: when subjects have at least a 26-day period with all blood Phe assessments  $\leq 600$   $\mu\text{mol/L}$  and are on stable dose, which is defined as on same dose with at least 80% compliance rate. The start of maintenance phase is the date of the first Phe assessment at which the above criteria are met.

Diet-only period is defined from study Day 1 until the day before first dose of pegvaliase or early termination or data cut-off date, whichever occurs earlier.

#### 4.5 Visit Window for Analysis

All efficacy and safety data will be summarized by study week of assessment. An assessment for a subject will be classified according to the study day of the assessment where it falls within a window. The windows are designated for each scheduled week of visit and centered on a target day. If there are two or more assessments within a designated window, the assessment that is closest to the target day will be used for analyses. If the two closest assessments to the target day are equidistant from the target day, then for numerical variable, the average of the two assessments will be used for analyses. For categorical variables, the worst of the 2 equidistant measurements, indicating less treatment effect, will be used.

Table 4.5.1 lists the scheduled weeks of the assessments collected in this study and the corresponding range of treatment days (window) during which a visit may have occurred.

**Table 4.5.1: Visit Time Windows for the Treatment Period**

Assessment: Blood Phe, Tyrosine, 3-day diet diary

| Pegvaliase | Derived Visit                                      | Target Day <sup>a</sup> | Window <sup>b</sup>                                |
|------------|----------------------------------------------------|-------------------------|----------------------------------------------------|
| Part 1     | Screening/Day 1                                    | Day 1                   | ≤ Day 1                                            |
|            | Week 2                                             | Day 8                   | Day 2 to Day 11                                    |
|            | Week XX ( $3 \leq XX \leq 8$ , every week)         | Day $(XX - 1) * 7 + 1$  | Day $(XX - 1) * 7 - 2$ to Day $(XX - 1) * 7 + 4$   |
|            | Week 9                                             | Day 57                  | Day 54 to Day 63                                   |
|            | Week XX ( $11 \leq XX \leq 19$ , every two weeks)  | Day $(XX - 1) * 7 + 1$  | Day $(XX - 1) * 7 - 6$ to Day $(XX - 1) * 7 + 7$   |
|            | Week 21                                            | Day 141                 | Day 134 to Day 154                                 |
|            | Week XX ( $25 \leq XX \leq 73$ , every four weeks) | Day $(XX - 1) * 7 + 1$  | Day $(XX - 1) * 7 - 13$ to Day $(XX - 1) * 7 + 14$ |
| Part 2     | Week XX ( $73 < XX \leq 209$ , every four weeks)   | Day $(XX - 1) * 7 + 1$  | Day $(XX - 1) * 7 - 13$ to Day $(XX - 1) * 7 + 14$ |
|            | Week 213                                           | Day 1485                | Day 1471 to Day 1491                               |
|            | Week 215                                           | Day 1499                | ≥ Day 1492                                         |

| Diet-Only | Derived Visit                                      | Target Day <sup>a</sup> | Window <sup>b</sup>                                |

|            | Week 25         | Day 169                 | Day 2 to Day 252     |
|            | Week 49         | Day 337                 | Day 253 to Day 420   |
|            | Week 73         | Day 505                 | Day 421 to Day 588   |
|            | Week 97         | Day 673                 | Day 589 to Day 756   |
|            | Week 121        | Day 841                 | Day 757 to Day 952   |
|            | Week 153        | Day 1065                | Day 953 to Day 1190  |
|            | Week 189        | Day 1317                | Day 1191 to Day 1442 |

| Diet-Only | Derived Visit   | Target Day <sup>a</sup> | Window <sup>b</sup>                        |
|-----------|-----------------|-------------------------|--------------------------------------------|
| Part 1    | Screening/Day 1 | Day 1                   | ≤ Day 1                                    |
|           | Week 25         | Day 8                   | Day 2 to Day 252                           |
|           | Week 49         | Day 57                  | Day 253 to Day 420                         |
|           | Week 73         | Day 505                 | Day 421 to Day of first dose of pegvaliase |

|        |          |                                 |                                        |
|--------|----------|---------------------------------|----------------------------------------|
| Part 2 | Week 73  | Day of first dose of pegvaliase | Day of first dose of pegvaliase        |
|        | Week 97  | Week 73 day + 168               | Week 73 day + 1 to Week 73 day + 251   |
|        | Week 121 | Week 73 day + 336               | Week 73 day + 252 to Week 73 day + 419 |
|        | Week 145 | Week 73 day + 504               | Week 73 day + 420 to Week 73 day + 587 |
|        | Week 169 | Week 73 day + 672               | Week 73 day + 588 to Week 73 day + 755 |
|        | Week 193 | Week 73 day + 840               | Week 73 day + 756 to Week 73 day + 916 |
|        | Week 215 | Week 73 day + 994               | ≥ Week 73 day + 917                    |

<sup>a</sup> Target days are relative to the Study Day 1.

<sup>b</sup> Visit day is calculated by (visit date – Study Day 1 + 1).

Diet only group: all Part 2 visit is relative to the first dose day of pegvaliase

#### 4.6 Handling of Dropouts and Missing Data

Participants who discontinued prematurely will not be replaced.

Missing dates or partially missing dates will be imputed conservatively for concomitant medications and AEs to ensure that an AE is considered treatment emergent when possible and has the longest possible duration. If the onset date of an AE is completely missing, the AE will be considered treatment-emergent. Missing data in blood Phe will be handled by multiple imputation method, more details are provided in Section 13.1.1

### 5 SUBJECT DISPOSITION

The total number of enrolled participants, the number (%) of participants who received study treatment, the number (%) of participants completed Part 1, the number (%) of participants who completed the study, and the number of participants in each analysis population (ITT, Safety, PP and PK), as appropriate, will be summarized.

### 6 DISCONTINUATION AND COMPLETION

For participants who prematurely discontinue the study, the primary reason for discontinuation will be summarized by treatment group. A similar summary will be provided for participants who discontinue study treatment. A subject listing of completion and early termination from study will also be provided.

## 7      **PROTOCOL DEVIATIONS**

Both major and minor protocol deviations will be summarized by deviation category. All protocol deviations will be listed. Participants with inclusion or exclusion criteria deviations will also be provided in a separate listing.

## 8      **DEMOGRAPHICS AND BASELINE CHARACTERISTICS**

Subject demographic and baseline characteristics will be summarized for the ITT population. Demographics include age, age category (12 to < 16 and 16 to < 18 years old), gender, race, country and ethnicity. Baseline characteristics include height, weight, BMI, blood Phe concentration, neurocognitive assessment, three-day average dietary intake, restricted diet, genotyping and antibody status.

## 9      **MEDICAL HISTORY**

Each subject's chronic diseases, disorders, and surgeries in the past will be collected as general medical history. General medical history will be summarized by System Organ Class (SOC) and Preferred Term (PT) by descending order of frequency. A by-subject listing of each subject's medical history will also be provided.

## 10     **PRIOR AND CONCOMITANT MEDICATIONS/PROCEDURES**

The following definitions will be used to determine prior and concomitant medications:

- Prior medications: any medications taken prior to first dose administration of pegvaliase (pegvaliase arm) or study day 1 (diet-only arm).
- Concomitant medications: any medications initially taken on or after first dose administration of pegvaliase (pegvaliase arm) or study day 1 (diet-only arm).
- Prior and concomitant medications: any medications taken both prior to and on or after first dose administration of pegvaliase (pegvaliase arm) or study day 1 (diet-only arm) will be reported both as prior and concomitant medications. Therefore, any such medications where the stop date is reported, reported as "continuing", or missing will be considered as both prior and concomitant medications.

In the event the start date of a medication is partial, the following imputation rules will be applied:

- If only day is missing, then the start date will be imputed as the first day of the month, if the year and month is same or after the study day 1 year and month. If only day is missing, then the start date will be imputed as the last day of the month, if the year and month is prior to the first dose year and month. If year and month are the same as

the year and month of study day 1 then the start date will be imputed as the date of study day 1.

- If only year is non-missing, then the start date will be imputed as the first day of the year if the year is after the year of study day 1. If year is the same as the year of study day 1 then the start date will be imputed as the date of study day 1. If year is before the year of study day 1 then start date will be imputed to the last date of the year.

In the event the stop date of a medication is partial, the following imputation rules will be applied:

- If only day is missing, then the end date will be imputed as the last day of the month.
- If only year is non-missing, then the end date will be imputed as the last day of the year.

All medications will be coded using the current version of the World Health Organization Drug (WHO Drug) dictionary (September 2021). Prior and concomitant medication use will be separately summarized by Anatomical Therapeutic Chemical (ATC) medication class (Level 4) and preferred name (i.e., generic medication name). A subject reporting the same medication use more than once will be counted once when calculating the number and percentage of participants who received that medication. A subject listing of each subject's prior and concomitant medications will be provided.

## 11 STUDY DRUG USAGE

Study drug usage rate will be calculated based on the drug exposure records captured in eCRFs and dispensed drug amount captured in the Interactive web response system (IWRS).

The overall study drug usage rate will be derived from the total amount of study drug intake divided by the total dispensed study drug amount over the study period and multiplied by 100%. The rate will be calculated for Part 1, Part 2 and overall study period.

## 12 EXTENT OF EXPOSURE TO STUDY TREATMENT

For pegvaliase treatment period, the total number of days on study treatment, total amount of study drug (mg) taken and average daily dose (mg) will be summarized for Part 1, Part 2 and overall study period. Any dose interruption longer than 28 days will be excluded from the total exposure duration calculation.

In addition, the total number of days on diet control treatment period will be summarized for diet-only arm, the summary of protein intake is described in [Section 13.2.1](#)

A by-subject listing of each subject's extent of exposure and compliance will be provided.

Compliance for pegvaliase will be calculated by the total amount of study drug intake divided by the total amount of study drug dispensed, and multiplied by 100%

## 13 EFFICACY EVALUATIONS

Unless otherwise specified, efficacy analysis will be based on the ITT population.

### 13.1 Primary Efficacy Endpoint

The primary efficacy endpoint is the change from baseline in blood Phe following 72 weeks on study. The blood Phe measurement following 72 weeks on study is defined as the average of the Week 69 and Week 73 blood Phe measurements. Change from baseline in blood Phe will be compared between participants in the active (pegvaliase) and the control (diet-only) treatment arms.

#### 13.1.1 Primary Estimand

Population: the target study population comprises adolescent participants (ages 12-17) with PKU who meet the inclusion and exclusion criteria as specified in the protocol. The analysis population is the ITT population as defined in Section 4.1

Variable: the variable is the primary efficacy endpoint, change from baseline in blood Phe following 72 weeks on study, as defined in Section 13.1.

Handling of missing data and intercurrent events (ICEs): the treatment policy strategy will be adopted which will include all blood Phe data regardless of intercurrent events such as treatment discontinuation. Missing blood Phe data will be imputed by multiple imputation methods as described in Section 13.1.2.

Population level summary: the difference in change from baseline in blood Phe following 72 weeks on study will be estimated by an Analysis of Covariance (ANCOVA) model with multiple imputation of missing data, as described in Section 13.1.2.

The hypotheses for the primary endpoint are:

$H_0$ : Mean reduction in blood Phe of pegvaliase arm  $\leq$  mean reduction in blood Phe of Diet-only arm

$H_a$ : Mean reduction in blood Phe of pegvaliase arm  $>$  mean reduction in blood Phe of Diet-only arm

The significance level of the hypothesis testing is 0.05 two-sided (0.025 one-sided). The success criteria is pegvaliase arm demonstrates significantly greater reduction in blood Phe compared to Diet-only arm

Proprietary and Confidential

### 13.1.2 Primary Analysis

The primary efficacy endpoint will be evaluated using an ANCOVA model, which will include baseline blood Phe levels as covariates, randomization strata (baseline Phe  $\leq 1000$   $\mu\text{mol/L}$  or  $> 1000$   $\mu\text{mol/L}$ ) and treatment group as factors, with missing data handled by multiple imputation. The imputation will be performed using the SAS procedure PROC MI; the variable list for imputation will include baseline and post-baseline blood Phe measurements and stratified by treatment. The MCMC method will be used to generate 100 imputation datasets. The least square (LS) mean and 95% confidence interval will be calculated for the treatment difference between pegvaliase and diet-only arms following 72 weeks on study. The primary analysis will be based on the ITT population.

Descriptive summary of observed values, change and percent change from baseline in blood Phe will be provided by visit and treatment

In Part 2, change and percent change in blood Phe from average of Week 69 and Week 73 visits will also be summarized for participants transitioning from control to pegvaliase by visits scheduled in Part 2.

### 13.1.3 Sensitivity Analysis

The same statistical model used in the primary analysis will be repeated in the PP population.

In addition, the primary analysis model (ANCOVA) will be repeated on the ITT population using 1) observed data only and 2) observed data and missing data imputed by Last Observation Carried Forward (LOCF).

## 13.2 Secondary Endpoints

The secondary endpoints are as follows:

- Change from baseline in total dietary protein intake (i.e., medical food and/or intact food) following 72 weeks on study. The total dietary protein intake following 72 weeks on study is defined as the mean total dietary protein intake calculated from the diet diaries collected at the Week 69 and Week 73 visits. Total dietary protein is measured in grams/kilogram (g/kg).
- Plasma sample for trough PK

### 13.2.1 Analysis on Secondary Endpoints

For the change from baseline in total dietary protein intake, the observed values, change and percent change from baseline at each visit will be summarized by treatment group. Similar summary will also be provided for protein intake from medical food and from intact food

separately. The values collected on the three-day diet diary will be averaged for each parameter at each visit before being summarized.

In Part 2, change and percent change in dietary protein intake from average of Week 69 and Week 73 visits will also be summarized for participants transitioning from control (diet-only) treatment arm to pegvaliase. For participants continuing pegvaliase in Part 2, change and percent change in dietary protein intake from Part 1 baseline will be summarized for data collected in Part 2.

For plasma sample of trough PK, table summary and subject listing of observed value will be provided at each visit. The PK parameters derived from the intensive PK samples will also be summarized. Details of PK analysis of pegvaliase concentration data will be provided in a separate Clinical Pharmacology analysis plan.

### 13.3 Exploratory Endpoints

The exploratory endpoints are as follows:

- The ADHD Rating Scale IV inattention subscale (ADHD RS-IV) rated by the parent/guardian and performed at Baseline (Day 1, pre-dose) and every 12 weeks throughout the study
- The Behavior Rating Inventory of Executive Function, Second Edition (BRIEF2) rated by the parent/guardian and performed at Baseline (Day 1, pre-dose) and every 12 weeks throughout the study
- Change from baseline (or first administration) in Phenylketonuria Symptom Severity and Impacts Scale (PKU-SSIS) Version 2.0 scores
- Change from baseline (or first administration) in global severity items (Patient Global Impression of Severity [PGIS], Caregiver Global Impression of Severity [CaGIS], and Clinician Global Impression of Severity [CGIS])
- Change in global change items (Patient Global Impression of Change [PGIC] and Caregiver Global Impression of Change [CaGIC])
- Time to participants' optimal maintenance dose
- Number of patients who require the highest (60mg/day) maintenance dose
- Percentage of patients in the blood Phe ranges of less than 600  $\mu\text{mol/L}$  and less than 360  $\mu\text{mol/L}$ , respectively

### **13.3.1 Exploratory Clinical Outcomes Assessment Measures**

#### **13.3.1.1 The ADHD Rating Scale IV (ADHD RS-IV) Inattention Subscale**

The ADHD RS-IV instrument is completed independently by the parent/guardian. The same parent/guardian must complete the scale at each scheduled time point. The instrument consists of 2 nine-item scales that evaluate symptom severity for inattention and hyperactivity/impulsivity, respectively, during the previous month. Each scale is scored separately. Each item is rated on a 4-point severity scale (0, none; 1, mild; 2, moderate; 3, severe); scores of 2 or 3 on an individual item indicate a symptom.

ADHD RS Inattention (IA) subscale is the sum of the 9 odd-numbered items.

ADHD RS Hyperactivity-Impulsivity (HI) subscale is the sum of the 9 even-numbered items

ADHD RS total score will be the sum of ADHD RS IA and ADHD RS HI

#### **13.3.1.2 Behavior Rating Inventory of Executive Function, Second Edition (BRIEF2)**

The BRIEF2 is a 63-item measure in 8 non-overlapping clinical scales and 2 validity scales. It is designed to assess executive function skills in children 5 to 18 years of age (Gioia 2002). The same parent/guardian must complete the BRIEF2 at each scheduled time point. These scales form 2 indexes: (1) Behavior Regulation (3 scales) and (2) Metacognition (5 scales), as well as a Global Executive Composite score which takes into account all of the clinical scales and represents the adolescent's overall executive function.

Behavior Regulation Index (BRI), Emotion Regulation Index (ERI), Cognitive Regulation Index (CRI) and Global Executive Composite (GEC) will be summarized, and their definition are as follows:

BRI = Inhibit + Self-Monitor

ERI = Shift + Emotional Control

CRI = Initiate + Working Memory + Plan/Organize + Task-Monitor + Organization of Materials

GEC = BRI + ERI + CRI

#### **13.3.1.3 PKU Symptom Severity and Impacts Scale (PKU-SSIS) v2.0 – Adolescent Version**

The PKU Symptom Severity and Impact Scale (PKU-SSIS) was designed to evaluate neuropsychological symptoms and impacts in early-treated patients with PKU. The PKU-SSIS is comprised of 22 items that constitute 3 symptoms domains: 1) Emotional, Mood and

Psychological; 2) (Neuro)cognitive, Executive, and Intellectual Function; 3) Physical Health. It also has 4 impact domains: 1) Social Relations; 2) Level of Independence; 3) General Wellbeing; and 4) Self-care (Quinn 2022). The instrument total score is compiled by summing the domain scores and converting to a percentage score (ie, Total score = (summed score/88)\*100). Participants will complete the PKU-SSIS as indicated in the SoA.

#### **13.3.1.4 Global Anchor Measures (Caregiver Global Impression of Severity [CaGIS], Caregiver Global Impression of Change [CaGIC], Patient Global Impression of Severity [PGIS], Patient Global Impression of Change [PGIC], and Clinician Global Impression of Severity [CGIS])**

Global impression measures for severity and change (or global anchors) are standard items that have been widely used across a broad range of disease areas and are typically included in clinical trials as anchor measures to help establish meaningful change in other COAs.

Global impression of severity anchor measures (for Caregivers and Patients) rate the overall disease severity using a 5-point Likert scale from “None/Not at all impacted” to “Very severe/Very severe impact.” Global impression of change anchor measures (for Caregivers, Participants, and Clinicians) assess if there has been an improvement or change in clinical status using a 5-point Likert scale from “Much better” to “Much worse.”.

#### **13.3.1.5 Analysis of Exploratory Clinical Outcomes Assessment Endpoints**

Descriptive summary will be provided for all exploratory endpoints by treatment group. ADHD RS-IV, BRIEF2, PKU-SSIS, and global anchor measures will be summarized at respective scheduled visits. Scale/domain scores and total scores for ADHD RS-IV, BRIEF2, and PKU-SSIS will be reported by timepoint. Change from baseline for ADHD RS-IV scores BRIEF2 scores and PKU-SSIS scores (by scale/domain and total scores for all three measures) will be summarized at each visit. Change from baseline for ADHD RS-IV scores will also be summarized for subjects with ADHD RS-IV IA and HI subscale score  $\geq 9$  at baseline. In addition, ANCOVA models will be performed, which will include baseline measurements (when available) as covariates, randomization strata (baseline Phe  $\leq 1000$   $\mu\text{mol/L}$  or  $> 1000$   $\mu\text{mol/L}$ ) and treatment group as factors. The least square (LS) mean and 95% confidence interval will be calculated for the treatment difference between pegvaliase and diet-only arms following 72 weeks on study. In Part 2, change scores from Week 73 visit will also be summarized for participants transitioning from control to pegvaliase.

### 13.3.2 Other Exploratory Analyses

#### 13.3.2.1 Sustained Blood Phe Reductions

Sustained blood Phe reductions will be evaluated by sustained Phe response (SPR) with a longitudinal model, where a nonparametric smoother is used to capture the expected value of blood Phe at time  $t$ ,  $E(\text{Phe}_t)$ , given adjacent or local blood Phe measures, and a 95% confidence band for the smoother estimate of  $E(\text{Phe}_t)$  will be calculated. The confidence band represents the range of plausible expected blood Phe values for any arbitrary point in time (interpolating over the time series), given locally retrospective and prospective information.

SPR is considered to have been achieved when the upper bound of the confidence band was below each of blood Phe concentration thresholds (120, 360, and 600  $\mu\text{mol/L}$ ).

Time spent in duration of  $\text{SPR} \leq 120, 360, \text{ and } 600 \mu\text{mol/L}$  and time to the first  $\text{SPR} \leq 120, 360, \text{ and } 600 \mu\text{mol/L}$  will be summarized by treatment arm.

#### 13.3.2.2 Blood Phe within Target Range

Duration and percentage of time with blood Phe  $\leq 120, 360, \text{ and } 600 \mu\text{mol/L}$  during Part 1 will be calculated for each subject as follows:

- 1) For blood Phe measurements collected after week 1 and up to week 73, identify the study visits with blood Phe in the target range ( $\leq 120, 360 \text{ or } 600 \mu\text{mol/L}$ )
- 2) For each visit identified in step 1), calculate duration of segment (in weeks) as study week of the current visit – study week of the previous visit
- 3) Calculate the total **duration of blood Phe in target range** as sum of duration of segments derived in step 2)
- 4) **Percentage of time in target range** is defined as total duration of blood Phe in target range / total follow-up time in Part 1

Descriptive summary will be provided for duration and percentage of time with blood Phe in target range by treatment arm

AUC and average blood Phe in target range ( $\leq 120, 360 \text{ or } 600 \mu\text{mol/L}$ ) during Part 1 will be calculated for each subject as follows:

- 5) For each visit identified in step 1), calculate the area of the segment as duration of the segment (derived in step 2)  $\times$  the associated blood Phe value
- 6) **AUC in target range** is defined as sum of the area of segments derived in step 5)

- 7) **Average blood Phe in target range** is defined as AUC in target range derived in step 6 / total duration of blood Phe in target range derived in step 3).

Descriptive summary will be provided for AUC and average blood Phe in target range  $\leq 120$ , 360, and 600  $\mu\text{mol/L}$  by treatment arm.

### 13.4 Examination of Efficacy by Subgroups

The following subgroup analysis will be performed on the primary endpoint:

- Baseline phe:  $\leq 1000 \mu\text{mol/L}$  or  $> 1000 \mu\text{mol/L}$
- Sex
- Baseline Age (12 to  $< 16$ , 16 to  $< 18$ )
- Country

## 14 SAFETY EVALUATIONS

Safety will be assessed by examining the incidence, exposure adjusted event rate, severity grade, and relationship to study drug of all treatment-emergent adverse events (TEAEs) reported during the study period. In addition, clinical laboratory results, vital signs, pregnancy test, physical exam and ECG values will be assessed. In general, two sets of safety analyses will be performed: Part 1 period and combined Part 1 and 2 periods. AE data will be summarized by the actual treatment received at the time of AE onset (pegvaliase or diet-only).

### 14.1 Adverse Events

AEs will be coded in accordance with the MedDRA (version 24.1). Only treatment-emergent adverse events (TEAEs) occurring and reported during the study period will be included in adverse event summaries. A TEAE is defined as any AE that newly appeared or worsened in severity after first dose of pegvaliase (pegvaliase arm) or on or after study day 1 (diet-only arm) until 30 days after last dose of the study.

In Part 2 participants transitioning from control to pegvaliase, a TEAE occurred during pegvaliase treatment period is defined as any AE that appeared or worsened in severity after first dose of pegvaliase until 30 days after last dose.

#### 14.1.1 All Adverse Events

The incidence and frequency of all treatment-emergent AEs will be summarized by system organ class (SOC), preferred term (PT), relationship to study drug and National Cancer Institute (NCI) Common Terminology Criteria for Adverse Events (CTCAE) severity grades.

Proprietary and Confidential

For AEs that occurred more than once during the study, the maximum severity will be used to summarize the AEs by severity.

If the onset date or end date of an adverse event is partial, the same imputation rules described in Section 2.6 will be applied.

The following summary will be performed for treatment-emergent AEs:

- All AEs by SOC and PT
- All AEs by SOC, PT and severity
- AEs assessed by investigators as related to study drug by SOC and PT
- AEs assessed by investigators as related to study drug by SOC, PT and severity
- Serious AEs (SAEs) by SOC and PT
- All AEs by PT in descending frequency order
- All AEs by SOC and PT with exposure adjusted event rate
- AEs leading to withdrawal from study by SOC and PT
- AEs leading to study drug discontinuation by SOC and PT

In addition, summary tables and listings will be provided for AEs of special interest:

- Acute systemic hypersensitivity reaction (refer to [Appendix 1](#))
- Anaphylaxis per FDA criteria (refer to [Appendix 1](#))
- Anaphylaxis per NIAID/FAAN criteria
- Angioedema per FDA criteria
- Angioedema per sponsor criteria
- Serum sickness-like reaction
- Hypersensitivity reaction (EU)
- Hypersensitivity reaction (US)
- Injection site reaction
- Injection site skin reaction  $\geq 14$  days duration
- Generalized skin reaction  $\geq 14$  days duration
- Severe injection site reaction defined as an injection site reaction that is considered CTCAE Grade  $\geq 3$

- Hypophenylalaninemia events (defined as blood Phe < 30  $\mu\text{mol/L}$  on 2 consecutive measurements)
- Arthralgia that is either persistent (AE duration  $\geq 6$  months), severe (CTCAE Grade  $\geq 3$ ), or that requires treatment with a steroid (excluding topical)
- Arthralgia (sponsor-defined)
- Neuropsychiatric disorder
- Hypersensitivity AEs
- Arthralgia /Arthritis
- Lymphadenopathy  $\geq 14$  Days Duration
- Persistent Urticaria  $\geq 14$  Days Duration
- Infection and Infestations  $\geq 30$  Days Duration
- Ischemic Heart Disease
- Proteinuria/Albuminuria
- Hematuria
- Blood Creatinine Increased
- Renal Impairment
- Increased liver function test or Events Involving Hepatic Impairment
- Anemia
- Thrombocytopenia
- Hemolysis
- Myalgia
- Serositis
- Potential central nervous system vascular complications

#### 14.2 Clinical Laboratory Tests

Descriptive statistics will be presented for clinical laboratory tests at each scheduled visit and for change in laboratory values from baseline. The proportion of participants who experienced at least one laboratory test result outside the normal ranges will be presented for each measurement as appropriate. Shift table from baseline to most extreme post-baseline value based on normal range and based on CTCAE grading (where available) will also be generated for each parameter as appropriate. A subject listing of laboratory test results for

hematology, chemistry, urinalysis, and other laboratory tests will be provided separately. Values with CTCAE Grade  $\geq 3$  will be flagged in the listings.

A listing of laboratory test results for participants with alanine transaminase (ALT) or alanine aminotransferase (AST)  $\geq 3$ x ULN and total bilirubin  $\geq 2$ x ULN will also be provided.

### **14.3 Vital Signs**

Vital signs will include systolic blood pressure (SBP) and diastolic blood pressure (DBP) measured in millimeters of mercury (mm Hg), heart rate in beats per minute, respiration rate in breaths per minute, and temperature in degrees Celsius (°C).

Summary statistics including n, mean, SD, median, minimum, and maximum will be provided for these parameters at each visit. A subject listing will also be provided.

### **14.4 12-lead Electrocardiogram**

The frequency of abnormalities and clinically significant abnormalities in 12-lead electrocardiogram will be summarized at each visit. A subject listing of ECG findings will be provided.

### **14.5 Physical Examination**

Physical examinations will include assessments of general appearance; head, eyes, ears, nose, and throat; the cardiovascular, dermatologic, lymphatic, respiratory, gastrointestinal, musculoskeletal, and neurologic systems. Other body systems may be examined if needed. A subject listing for clinically significant findings at each visit will be provided.

### **14.6 Pregnancy Test**

A subject listing for pregnancy urine sample test at each visit will be provided.

## 15 IMMUNOGENICITY TESTS

Immunogenicity will be performed using validated immunogenicity assays. Immunogenicity assays include total anti-pegvaliase antibodies (TAb), anti-PAL IgG, anti-PAL IgM, anti-PEG IgM, anti-PEG IgG, and neutralizing antibodies (NAb). In the event of a Hypersensitivity Reaction visit (HRV), anti-pegvaliase IgE will be assessed.

For immunogenicity analysis, incidence tables and titer summary statistics including mean, median, standard deviation, and minimum/maximum titer values at each study visit will be provided for each antibody analyte.

Anti-drug antibody impact on safety will be evaluated. Plots and tables will be generated to explore the potential impact of anti-drug antibodies on Hypersensitivity Reaction (US and EU) frequency and severity. A listing will be provided for each subject who has Hypersensitivity Reaction Visit.

Anti-drug antibody impact on efficacy will also be evaluated. Plots and tables may be generated to explore the potential impact of anti-drug antibodies on blood Phe levels.

## 16 APPENDICES

### Appendix 1: Search Strategies for Adverse Event of Special Interest, and Sponsor Defined AEs of Clinical Significance

MedDRA version: most current version at program termination

#### 1. Anaphylaxis per NIAID/FAAN criteria

Anaphylaxis per NIAID/FAAN is defined using the NIAID/FAAN clinical diagnostic criteria through review on the potential anaphylaxis per NIAID/FAAN cases, which are identified using Broad algorithmic anaphylactic reaction SMQ with the below algorithm:

Algorithm = A or (B and C) or (D and (B or C))

| Name of Search                              | Category | Preferred Term                    |
|---------------------------------------------|----------|-----------------------------------|
| Broad Algorithmic Anaphylactic Reaction SMQ | A        | Anaphylactic reaction             |
|                                             | A        | Anaphylactic shock                |
|                                             | A        | Anaphylactic transfusion reaction |
|                                             | A        | Anaphylactoid reaction            |
|                                             | A        | Anaphylactoid shock               |
|                                             | A        | Circulatory collapse              |
|                                             | A        | Dialysis membrane reaction        |
|                                             | A        | Kounis syndrome                   |
|                                             | A        | Procedural shock                  |
|                                             | A        | Shock                             |
|                                             | A        | Shock symptom                     |
|                                             | A        | Type I hypersensitivity           |
|                                             | B        | Acute respiratory failure         |
|                                             | B        | Asthma                            |
|                                             | B        | Bronchial oedema                  |
|                                             | B        | Bronchospasm                      |
|                                             | B        | Cardio-respiratory distress       |
|                                             | B        | Chest discomfort                  |
|                                             | B        | Choking                           |
|                                             | B        | Choking sensation                 |
|                                             | B        | Circumoral oedema                 |
|                                             | B        | Cough                             |
|                                             | B        | Cough variant asthma              |

| Name of Search | Category | Preferred Term                                  |
|----------------|----------|-------------------------------------------------|
|                | B        | Cyanosis                                        |
|                | B        | Dyspnoea                                        |
|                | B        | Hyperventilation                                |
|                | B        | Irregular breathing                             |
|                | B        | Laryngeal dyspnoea                              |
|                | B        | Laryngeal oedema                                |
|                | B        | Laryngospasm                                    |
|                | B        | Laryngotracheal oedema                          |
|                | B        | Mouth swelling                                  |
|                | B        | Nasal obstruction                               |
|                | B        | Oedema mouth                                    |
|                | B        | Oropharyngeal oedema                            |
|                | B        | Oropharyngeal spasm                             |
|                | B        | Oropharyngeal swelling                          |
|                | B        | Pharyngeal oedema                               |
|                | B        | Pharyngeal swelling                             |
|                | B        | Respiratory arrest                              |
|                | B        | Respiratory distress                            |
|                | B        | Respiratory failure                             |
|                | B        | Reversible airways obstruction                  |
|                | B        | Sensation of foreign body                       |
|                | B        | Sneezing                                        |
|                | B        | Stridor                                         |
|                | B        | Swollen tongue                                  |
|                | B        | Tachypnoea                                      |
|                | B        | Throat tightness                                |
|                | B        | Tongue oedema                                   |
|                | B        | Tracheal obstruction                            |
|                | B        | Tracheal oedema                                 |
|                | B        | Upper airway obstruction                        |
|                | B        | Vaccine associated enhanced respiratory disease |
|                | B        | Wheezing                                        |
|                | C        | Allergic oedema                                 |
|                | C        | Angioedema                                      |
|                | C        | Circumoral swelling                             |
|                | C        | Erythema                                        |

| Name of Search | Category | Preferred Term                     |
|----------------|----------|------------------------------------|
|                | C        | Eye oedema                         |
|                | C        | Eye pruritus                       |
|                | C        | Eye swelling                       |
|                | C        | Eyelid oedema                      |
|                | C        | Face oedema                        |
|                | C        | Flushing                           |
|                | C        | Injection site urticaria           |
|                | C        | Lip oedema                         |
|                | C        | Lip swelling                       |
|                | C        | Nodular rash                       |
|                | C        | Ocular hyperaemia                  |
|                | C        | Oedema                             |
|                | C        | Oedema blister                     |
|                | C        | Periorbital oedema                 |
|                | C        | Periorbital swelling               |
|                | C        | Pruritus                           |
|                | C        | Pruritus allergic                  |
|                | C        | Rash                               |
|                | C        | Rash erythematous                  |
|                | C        | Rash pruritic                      |
|                | C        | Skin swelling                      |
|                | C        | Swelling                           |
|                | C        | Swelling face                      |
|                | C        | Swelling of eyelid                 |
|                | C        | Urticaria                          |
|                | C        | Urticaria papular                  |
|                | D        | Blood pressure decreased           |
|                | D        | Blood pressure diastolic decreased |
|                | D        | Blood pressure systolic decreased  |
|                | D        | Cardiac arrest                     |
|                | D        | Cardio-respiratory arrest          |
|                | D        | Cardiovascular insufficiency       |
|                | D        | Diastolic hypotension              |
|                | D        | Hypotension                        |
|                | D        | Hypotensive crisis                 |
|                | D        | Post procedural hypotension        |

## 2. Anaphylaxis per FDA criteria

Anaphylaxis events defined according to the Division of Pulmonary, Allergy, and Rheumatology Products (DPARP) methodology are referred to as “anaphylaxis per FDA criteria”. The FDA’s assessment methodology includes individual case safety reports with any of the following characteristics:

- Clinical manifestations consistent with National Institute of Allergy and Infectious Disease/Food Allergy and Anaphylaxis Network (NIAID/FAAN) Criterion #1 (skin involvement + respiratory or cardiovascular compromise); or
- Verbatim reports of anaphylaxis/anaphylactic reaction (or synonyms), even if NIAID/FAAN criteria were not met; or
- Cases involving subject injection of epinephrine alone, even if subject did not experience signs/symptoms necessary to meet NIAID/FAAN criteria.

## 3. Acute systemic hypersensitivity reaction

An acute systemic hypersensitivity reaction (referred to as anaphylaxis in the protocol) is defined as an episode meeting National Institute of Allergy and Infectious Disease/Food Allergy and Anaphylaxis Network (NIAID/FAAN) criteria according to an internal BioMarin assessment performed by the Internal Data Safety Review Board. The acute systemic hypersensitivity reaction events will also be presented if they meet Brown’s severe criteria as determined by the Internal Safety Review Board.

## 4. Angioedema per FDA criteria

Angioedema as an AE reported as any PT in the MedDRA Angioedema Higher Level Term excluding idiopathic angioedema, Gleich’s syndrome, and hereditary angioedema (see PT term list below:

|                        |
|------------------------|
| Angioedema             |
| Circumoral oedema      |
| Eyelid oedema          |
| Face oedema            |
| Intestinal angioedema  |
| Laryngeal oedema       |
| Laryngotracheal oedema |
| Lip oedema             |
| Lip swelling           |
| Mouth swelling         |

|                           |
|---------------------------|
| Oculorespiratory syndrome |
| Oedema mouth              |
| Oropharyngeal swelling    |
| Periorbital oedema        |
| Pharyngeal oedema         |
| Swelling face             |
| Swollen tongue            |
| Tongue oedema             |

and also excluding any AE which is part of an Anaphylaxis per FDA criteria episode.

### 5. Angioedema per sponsor criteria

A 2-step process to identify angioedema per sponsor criteria, the following assessment was performed on the entire AE dataset:

- Step 1: all reported ADRs suggestive of angioedema using the Angioedema MedDRA HLT search, which includes the following 21 PTs: angioedema, circumoral oedema, eyelid oedema, face oedema, Gleich's syndrome, hereditary angioedema, idiopathic angioedema, intestinal angioedema, laryngeal oedema, laryngotracheal oedema, lip oedema, lip swelling, mouth swelling, oculorespiratory syndrome, oedema mouth, oropharyngeal swelling, periorbital oedema, pharyngeal oedema, swelling face, swollen tongue, and tongue oedema.
- Step 2: BioMarin then clinically assessed the retrieved data identified from Step 1 to assign concurrent events into episodes and to exclude:
  - False positive ADR reports that have clear confounders which impact assessment, e.g., onset of event(s)  $\geq 30$  days after last dose or events/episodes with a very clear alternative etiology, such as throat swelling secondary to intubation). Cases were not excluded where the events have a long duration which may be atypical for angioedema, or where events occurred concurrent with other conditions which may have contributed to their development (e.g., eye swelling reported during episode(s) of seasonal allergy).
- Episodes which occurred as part of an acute systemic hypersensitivity reaction and, therefore, will already be included in the incidence for acute systemic hypersensitivity reactions (to avoid duplication).

In the sponsor's opinion, the methodology described above is more likely to be reflective of the true incidence of angioedema manifestations.

#### **6. Serum Sickness-like reaction**

Serum sickness-like reaction will be defined by including all preferred term of serum sickness, serum sickness-like reactions and Type III immune complex mediated reactions.

#### **7. Hypersensitivity Reaction (EU)**

Hypersensitivity reactions are defined as the modified hypersensitivity SMQ (narrow SMQ) or an anaphylaxis event as described in [Appendix 1](#) - Listing 1 and adjudicated as per the Acute Systemic Hypersensitivity Reaction in section 10.5.2 in Protocol

The following terms should be excluded from the Modified Hypersensitivity (Narrow SMQ) search criteria:

injection site rash

injection site urticaria

#### **8. Hypersensitivity Reaction (US)**

Hypersensitivity reaction is defined as the modified hypersensitivity SMQ (narrow SMQ), plus the anaphylaxis adjudicated by FDA criteria.

The following terms should be excluded from the Modified Hypersensitivity (Narrow SMQ) search criteria:

injection site rash

injection site urticaria

anaphylactic reaction

anaphylactoid reaction

#### **9. Injection site reaction**

Injection-site reaction will be identified using injection site reaction Higher Level MedDRA term.

### 10. Severe Injection-site reaction

Severe injection site reaction will be identified as any injection site reaction report that is reported as Common Terminology Criteria for Adverse Events (CTCAE) Grade 3 or above in severity and meeting MedDRA high level term (HLT) for Injection site reaction.

### 11. Injection site skin reaction $\geq 14$ days duration

Injection site skin reaction with  $\geq 14$  days duration will be identified by preferred term search using the list below. To be included as injection site skin reaction, the duration of the event needs to be  $\geq 14$  days (Multiple AE records with same preferred term and  $\leq 1$  day difference between the start date and end date and with severity worsens are considered as same event).

| Name of Search               | Preferred Term                     |
|------------------------------|------------------------------------|
| Injection site skin reaction | Injection site anaesthesia         |
|                              | Injection site extravasation       |
|                              | Injection site phlebitis           |
|                              | Injection site movement impairment |
|                              | Injection site lymphadenopathy     |
|                              | Injection site atrophy             |
|                              | Injection site cyst                |
|                              | Injection site erosion             |
|                              | Injection site fibrosis            |
|                              | Injection site granuloma           |
|                              | Injection site induration          |
|                              | Injection site mass                |

## 12. Generalized skin reaction $\geq$ 14 days duration

Generalized skin reaction  $\geq$  14 days duration will be identified in following ways:

- Preferred term search using below listing, or

Proprietary and Confidential

- Broad vasculitis SMQ

To be included as generalized skin reaction, the duration of the event needs to be  $\geq 14$  days (Multiple AE records with same preferred term and  $\leq 1$  day difference between the start date and end date and with severity worsens are considered as same event).

| Name of Search            | Preferred Term                             |
|---------------------------|--------------------------------------------|
| Generalized Skin Reaction | Acute cutaneous lupus erythematosus        |
|                           | Acute febrile neutrophilic dermatosis      |
|                           | Acute generalised exanthematous pustulosis |

**13. Arthralgia (sponsor defined)**

Arthralgia combines preferred term of arthralgia, pain in extremity, back pain, musculoskeletal pain, neck pain.

**14. Arthralgia (steroid treated)**

To identify the events of arthralgia that were treated with steroids (excluding topicals), the following steps are required.

- Identify the events of arthralgia (Arthralgia combines the preferred terms: of arthralgia, pain in extremity, back pain, musculoskeletal pain, neck pain), and Identify those arthralgia AEs that were treated with a concomitant medication after the onset date of the start of the arthralgia AE and before the resolution date of the arthralgia AE; and
- The resultant file will be clinically reviewed by BioMarin to identify the arthralgia events that were treated with a concomitant steroid (excluding those events that were administered topically, or where the steroid medication was used during an arthralgia episode but for an indication other than arthralgia).

**15. Severe or Persistent ( $\geq 6$  months) arthralgia**

Arthralgia will be identified as the preferred terms of arthralgia, pain in extremity, back pain, musculoskeletal pain, and neck pain. Persistent arthralgia is defined as any arthralgia event that has a duration of the event  $\geq 6$  months (Multiple AE records with same reported term and  $\leq 1$  day difference between the start date and end date are considered as same event). Severe arthralgia is defined as any arthralgia event that is reported as CTCAE Grade 3 or above in severity.

**16. Hypophenylalaninemia**

Hypophenylalaninemia is defined as a blood phenylalanine (Phe) level  $\leq 30$   $\mu\text{mol/L}$  for a minimum of 2 consecutive values, with the start of the event defined as the first blood Phe assessment day with  $< 30$   $\mu\text{mol/L}$  and the end of the event defined as the day prior to the first blood Phe assessment  $\geq 30$   $\mu\text{mol/L}$ .

**17: Neuropsychiatric disorder**

A neuropsychiatric disorder is defined as Psychiatric disorder SOC + modified Nervous system SOC.

| Name of Search       | Preferred Term                   |
|----------------------|----------------------------------|
| Modified nervous SOC | Acalculia                        |
|                      | Agitation postoperative          |
|                      | Agnosia                          |
|                      | Agraphia                         |
|                      | AIDS dementia complex            |
|                      | Akathisia                        |
|                      | Altered state of consciousness   |
|                      | Amnesia                          |
|                      | Amnestic disorder                |
|                      | Anosognosia                      |
|                      | Anterograde amnesia              |
|                      | Aphasia                          |
|                      | Apraxia                          |
|                      | Aura                             |
|                      | Autism                           |
|                      | Borderline mental impairment     |

|  | Symbolic dysfunction    |
|  | Unresponsive to stimuli |
|  | Verbigeration           |

### 18: Hypersensitivity AEs

Hypersensitivity AEs will be identified in two ways:

- Broad Algorithmic anaphylactic reaction Standardized MedDRA Queries (SMQ) with the below algorithm:

$$\text{Algorithm} = A \text{ or } (B \text{ and } C) \text{ or } (D \text{ and } (B \text{ or } C))$$

- Modified Hypersensitivity SMQ to include below additional preferred terms

| Name of Search                                               | Preferred Term   |
|--------------------------------------------------------------|------------------|
| Additional preferred terms for Modified Hypersensitivity SMQ | Arthralgia       |
|                                                              | Arthritis        |
|                                                              | Eye inflammation |
|                                                              | Eye irritation   |
|                                                              | Eye pain         |
|                                                              | Joint stiffness  |
|                                                              | Joint swelling   |
|                                                              | Pyrexia          |
|                                                              | Vision blurred   |
|                                                              | Polyarthritis    |

### 19: Arthralgia /Arthritis:

Arthralgia combines preferred term of arthralgia, Joint crepitation, Joint effusion, Joint destruction, Joint noise, Joint swelling, Joint stiffness.

Arthritis was identified using following preferred terms:

| Name of Search | Preferred Term                                                    |
|----------------|-------------------------------------------------------------------|
| Arthritis      | Amyloid arthropathy                                               |
|                | Antithyroid arthritis syndrome                                    |
|                | Arthritis                                                         |
|                | Arthritis allergic                                                |

|                | Neuropathic arthropathy                                           |
|                | Palindromic rheumatism                                            |
|                | Polyarthritis                                                     |
|                | Poncet's disease                                                  |
|                | Pyogenic sterile arthritis pyoderma gangrenosum and acne syndrome |
|                | Reiter's syndrome                                                 |
|                | Rheumatic fever                                                   |
|                | Sacroiliitis                                                      |
|                | Seronegative arthritis                                            |
|                | SLE arthritis                                                     |
|                | Sympathetic posterior cervical syndrome                           |
|                | Traumatic arthritis                                               |
|                | Traumatic arthropathy                                             |

**20: Lymphadenopathy  $\geq$  14 Days Duration**

Lymphadenopathy will be identified from preferred terms outlined below. To be included in the results, the duration of the event should be  $\geq$  14 days (Multiple AE records with same preferred term and  $\leq$  1 day difference between the start date and end date and with severity worsens are considered as same event).

| Name of Search  | Preferred Term                         |
|-----------------|----------------------------------------|
| Lymphadenopathy | Abdominal lymphadenopathy              |
|                 | Hilar lymphadenopathy                  |
|                 | Injection site lymphadenopathy         |
|                 | Lymph node calcification               |
|                 | Lymph node fibrosis                    |
|                 | Lymph node pain                        |
|                 | Lymphadenitis                          |
|                 | Lymphadenocyst                         |
|                 | Lymphadenopathy                        |
|                 | Lymphadenopathy mediastinal            |
|                 | Lymphatic disorder                     |
|                 | Lymphoid tissue hyperplasia            |
|                 | Paratracheal lymphadenopathy           |
|                 | Persistent generalised lymphadenopathy |
|                 | Retroperitoneal lymphadenopathy        |
|                 | Spleen disorder                        |
|                 | Splenomegaly                           |
|                 | lymph node palpable                    |

**21: Persistent Urticaria  $\geq$  14 Days Duration**

Persistent urticaria will be identified using preferred term: urticaria, with event duration  $\geq$  14 days (Multiple AE records with same reported term and  $\leq$  1 day difference between the start date and end date and with severity worsens were considered as same event).

**22: Infection and Infestations  $\geq$  30 Days Duration**

Infection and Infestations will be identified using Infection and Infestations SOC. To be included in the result, the duration of the event should be  $\geq$  30 days (Multiple AE records with same reported term and  $\leq$  1 day difference between the start date and end date and with severity worsens were considered as same event).

**23: Ischemic Heart Disease**

Ischemic heart disease will be identified using myocardial infarction narrow SMQ + Other Ischemic heart disease SMQ

**24: Proteinuria/Albuminuria**

Proteinuria/Albuminuria will be identified using the modified Proteinuria SMQ (narrowed SMQ adding a couple of the terms from the broad SMQ).

| Name of Search          | Preferred Term                           |
|-------------------------|------------------------------------------|
| Proteinuria/Albuminuria | Albumin globulin ratio increased         |
|                         | Albumin urine present                    |
|                         | Albuminuria                              |
|                         | Bence Jones protein urine present        |
|                         | Bence Jones proteinuria                  |
|                         | Beta 2 microglobulin urine increased     |
|                         | Globulinuria                             |
|                         | Microalbuminuria                         |
|                         | Myoglobinuria                            |
|                         | Orthostatic proteinuria                  |
|                         | Protein urine                            |
|                         | Protein urine present                    |
|                         | Proteinuria                              |
|                         | Urine albumin/creatinine ratio abnormal  |
|                         | Urine albumin/creatinine ratio increased |
|                         | Urine protein/creatinine ratio abnormal  |
|                         | Urine protein/creatinine ratio increased |
|                         | Aminoaciduria                            |
|                         | Haemoglobinuria                          |

**25: Hematuria**

Hematuria was identified using following preferred terms:

| Name of Search | Preferred Term                 |
|----------------|--------------------------------|
| Hematuria      | Haematuria                     |
|                | Haemoglobin urine present      |
|                | Haemoglobin urine              |
|                | Haemoglobinuria                |
|                | Red blood cells urine positive |
|                | Red blood cells urine          |
|                | Blood urine present            |
|                | Blood urine                    |

## 26: Blood Creatinine Increased

Blood creatinine increased will be identified using the following preferred terms: Blood creatinine abnormal, blood creatinine increased.

## 27: Renal Impairment

Renal impairment will be identified using a combination of modified narrow tubulointerstitial diseases SMQ, modified narrow acute renal failure SMQ, and modified narrow chronic kidney disease SMQ.

| Name of Search                                    | Preferred Term                            |
|---------------------------------------------------|-------------------------------------------|
| Modified narrow tubulointerstitial diseases (SMQ) | Acidosis hyperchloraemic                  |
|                                                   | Acquired aminoaciduria                    |
|                                                   | Acute phosphate nephropathy               |
|                                                   | Aminoaciduria                             |
|                                                   | Beta-N-acetyl-D-glucosaminidase increased |
|                                                   | Crystal nephropathy                       |
|                                                   | Eosinophils urine present                 |
|                                                   | Fanconi syndrome acquired                 |
|                                                   | Hyperphosphaturia                         |
|                                                   | Isosthenuria                              |
|                                                   | Nephritis allergic                        |
|                                                   | Nephrogenic diabetes insipidus            |
|                                                   | Nephropathy toxic                         |
|                                                   | Renal glycosuria                          |
|                                                   | Renal papillary necrosis                  |
|                                                   | Renal tubular acidosis                    |

|  |                                                   |
|--|---------------------------------------------------|
|  | Renal tubular atrophy                             |

|  | Urine protein/creatinine ratio increased |
|  |                                          |

## 28: Increased liver function test or Events Involving Hepatic Impairment

Increased liver function test (LFT) or events involving hepatic impairment will be identified using modified hepatocellular damage and hepatitis NEC HLT plus broad Liver related investigations, signs and symptoms SMQ.

Additional preferred terms for modified hepatocellular damage and hepatitis NEC HLT:

| Name of Search                                                                      | Preferred Term                   |
|-------------------------------------------------------------------------------------|----------------------------------|
| Additional preferred terms for modified hepatocellular damage and hepatitis NEC HLT | Autoimmune hepatitis             |
|                                                                                     | Allergic hepatitis               |
|                                                                                     | Chronic hepatitis                |
|                                                                                     | Drug-induced liver injury        |
|                                                                                     | Hepatitis                        |
|                                                                                     | Hepatitis acute                  |
|                                                                                     | Hepatitis fulminant              |
|                                                                                     | Hepatitis toxic                  |
|                                                                                     | Hepatocellular injury            |
|                                                                                     | Hepatotoxicity                   |
|                                                                                     | Liver injury                     |
|                                                                                     | Non-alcoholic fatty liver        |
|                                                                                     | Non-alcoholic steatohepatitis    |
|                                                                                     | Nonalcoholic fatty liver disease |
|                                                                                     | Steatohepatitis                  |

| Name of Search                                         | Preferred Term                                |

|  |                                      |
|--|--------------------------------------|
|  | Oedema due to hepatic disease        |
|  | Perihepatic discomfort               |
|  | Retrograde portal vein flow          |
|  | Total bile acids increased           |
|  | Transaminases abnormal               |
|  | Transaminases increased              |
|  | Ultrasound liver abnormal            |
|  | Urine bilirubin increased            |
|  | X-ray hepatobiliary abnormal         |
|  | 5'nucleotidase increased             |
|  | Blood alkaline phosphatase abnormal  |
|  | Blood alkaline phosphatase increased |
|  | Blood cholinesterase abnormal        |
|  | Blood cholinesterase decreased       |
|  | Deficiency of bile secretion         |
|  | Glutamate dehydrogenase increased    |
|  | Haemorrhagic ascites                 |
|  | Hepatic fibrosis marker abnormal     |
|  | Hepatic fibrosis marker increased    |
|  | Hypoalbuminaemia                     |
|  | Leucine aminopeptidase increased     |
|  | Liver iron concentration abnormal    |
|  | Liver iron concentration increased   |
|  | Periportal oedema                    |
|  | Peritoneal fluid protein abnormal    |
|  | Peritoneal fluid protein decreased   |
|  | Peritoneal fluid protein increased   |
|  | Pneumobilia                          |
|  | Portal vein flow decreased           |

|  |                                   |
|--|-----------------------------------|
|  | Portal vein pressure increased    |
|  | Retinol binding protein decreased |
|  | Urobilinogen urine decreased      |
|  | Urobilinogen urine increased      |

### 29: Anemia

Anemia will be identified using following preferred terms:

| Name of Search | Preferred Term        |
|----------------|-----------------------|
| Anemia         | Anaemia               |
|                | Anaemia macrocytic    |
|                | Anaemia megaloblastic |
|                | Hyperchromic anaemia  |
|                | Hypochromic anaemia   |
|                | Microcytic anaemia    |
|                | Sideroblastic anaemia |

### 30: Thrombocytopenia

Thrombocytopenia will be identified using following preferred terms:

| Name of Search   | Preferred Term                  |
|------------------|---------------------------------|
| Thrombocytopenia | Thrombocytopenia                |
|                  | Immune thrombocytopenic purpura |
|                  | Platelet production decreased   |
|                  | Thrombocytopenic purpura        |
|                  | Platelet count decreased        |
|                  | Platelet count abnormal         |
|                  | Platelet destruction increased  |
|                  | Platelet disorder               |
|                  | Platecrit abnormal              |
|                  | Platecrit decreased             |

### 31: Hemolysis

Hemolysis will be identified using broad haemolytic disorders SMQ.

| Name of Search | Preferred Term                                      |
|----------------|-----------------------------------------------------|
| Hemolysis      | ABO haemolytic disease of newborn                   |
|                | ABO incompatibility                                 |
|                | Acid haemolysin test positive                       |
|                | Acute haemolytic transfusion reaction               |
|                | Alloimmunisation                                    |
|                | Anti A antibody positive                            |
|                | Anti B antibody positive                            |
|                | Anti-erythrocyte antibody positive                  |
|                | Autoimmune haemolytic anaemia                       |
|                | Blood incompatibility haemolytic anaemia of newborn |
|                | Cardiac haemolytic anaemia                          |
|                | Cold agglutinins positive                           |
|                | Cold type haemolytic anaemia                        |
|                | Coombs direct test positive                         |
|                | Coombs indirect test positive                       |
|                | Coombs negative haemolytic anaemia                  |
|                | Coombs positive haemolytic anaemia                  |
|                | Coombs test positive                                |

**32: Myalgia**

Myalgia will be identified using the following PT: Fibromyalgia, Myalgia, Myalgia intercostal, Myofascial pain syndrome, Neuromuscular pain

**33: Serositis**

Serositis will be identified using following preferred terms:

| Name of Search | Preferred Term            |
|----------------|---------------------------|
| Serositis      | Pericardial effusion      |
|                | Pericardial rub           |
|                | Pericarditis              |
|                | Pleural effusion          |
|                | Pleural rub               |
|                | Pleurisy                  |
|                | Pleuropericarditis        |
|                | Polyserositis             |
|                | Serositis                 |
|                | Peritonitis               |
|                | Noninfectious peritonitis |
|                | Ascites                   |

| Name of Search | Preferred Term |
|----------------|----------------|
|                | Lymphocele     |
|                | Chylothorax    |

### 34: Potential central nervous system vascular complications

Potential central nervous system (CNS) vascular complications will be identified using ischaemic central nervous system vascular conditions (SMQ).
