1. Introduction

1.1 Background

Vitiligo is an acquired skin disorder characterised by depigmented patches of skin that may appear in a localised or generalised distribution. Vitiligo is estimated to affect 0.5-2% of the global population with an equal incidence between genders, age or racial/ethnic groups (1). The exact cause of the loss of functioning melanocytes in vitiligo remains unknown but is likely to be resulted from the complex interplay of genetics, oxidative stress, and autoimmunity (2).

Although vitiligo is typically asymptomatic, it may substantially affect the psychological wellbeing of people living with the condition (3-5). This could be due to the unpredictable prognosis, the current lack of cure or the perception and emotional burden associated with the visibility of vitiligo. A recent systematic review has shown that people with vitiligo are significantly more likely to suffer from depression and anxiety compared to the healthy controls (6). However, there is a lack of knowledge of the other types of psychological symptoms/disorders that people with vitiligo experience (7).

Human society places a profound significance on appearance, aesthetics and pigmentation (8). Vitiligo is visible on all skin types, and is particularly noticeable on dark skin tones because of the strong contrast. Given the visible difference in appearance of affected and unaffected areas of the skin the condition has been construed as being disfiguring. Some studies have suggested in those with darker skin vitiligo is correlated with a worse quality of life (QoL) (9, 10). However, these studies have small sample sizes and psychiatric comorbidities and psychological wellbeing were not evaluated in the analyses. Further, there are other studies that indicate that people with lighter skin tones may also experience distress (11).

In addition to skin colour, the location of vitiligo lesions may also influence the overall well-being and stigmatisation experience of patients. However, inconsistent findings have been reported. A few studies showed that patients had a more significant QoL impairment

when lesions were located on visible sites (e.g. face, neck and hand) (12, 13) whilst other studies did not find any relationship (14, 15). By contrast, some studies report vitiligo lesions on more central body parts (e.g. chest, arms and trunks) are more likely to have an adverse impact on emotional wellbeing of people with the condition, perhaps because there remains anxiety as to how they might be judged by others if the condition were to be revealed (9, 16). Indeed, the nature of reactions received from others is also likely to play an integral role in adjustment and the extent to which stigmatisation is experienced (17, 18). Additional data from mixed method studies is needed to further understand this topic and how this may affect the possible comorbid burden of mental health conditions.

There is currently a lack of large population-based studies providing reliable estimates of the risks of psychological comorbidities associated with vitiligo in the UK. A recent observational study using the UK-THIN database (19) highlighted the burden of depression in vitiligo patients and found a bidirectional relationship between the two conditions. However, the study did not explore the associations with other forms of psychological distress and did not use a validated definition for depression. An analysis of the depression risk on the populations of different ethnicity and location of the vitiligo lesions, which can be potential sources of heterogeneity, were also not conducted.

1.2. Purposes of analyses

To the best of our knowledge, there has only been one large population-based study assessing psychosocial comorbidities in vitiligo compared to those without the condition (19). This study was limited only to exploring major depressive disorder (MDD, also termed recurrent depressive disorder) and used an unvalidated case definition for MDD. There have been no large-scale population studies looking at the association between vitiligo and depressive episodes (not meeting the criteria for MDD), anxiety, social phobias and other potential psychological complications of vitiligo. No current study explores the relationship with ethnicity and psychological outcomes or the associations between vitiligo location and a broader range of psychological outcomes beyond MDD. The purpose of this study is therefore to fill this evidence gap.

2. Study objectives and endpoints

2.1 Study objectives

The objective of this study is to determine the risks of comorbid mental health conditions (including depression, anxiety and other potential psychological complications of vitiligo) in people with vitiligo compared to a control population and to evaluate whether the relative risks may vary by different ethnicities.

2.2 Primary objectives

- Briefly describe the epidemiology of vitiligo in the dataset: vitiligo incidence of vitiligo over time and by age, sex, ethnicity and sociodemographic factors and lifetime prevalence by age and sex.
- Describe the prevalence of common mental health conditions (depressive episodes, recurrent depressive disorder and anxiety disorder), overall and stratified by sociodemographic factors and location of lesion.
- Describe the incidence of common mental health conditions (depressive episodes, recurrent depressive disorder and anxiety disorders), overall and stratified by sociodemographic factors and lesion location.
- Describe current primary care service utilisation in those vitiligo cases and matched controls having a prevalent depressive illness or anxiety disorder at their index date.
- Describe management patterns in those vitiligo cases and matched controls having a prevalent depressive illness or anxiety disorder at their index date.

2.3 Secondary objectives:

- Describe the baseline prevalence and post diagnosis incidence of other potential psychological or work-related complications of vitiligo.

2.4 Primary endpoints

- Vitiligo prevalence: A diagnosis of vitiligo at any time prior to 31 December 2020.
- Mental health condition prevalence: A diagnosis of the relevant common mental health condition prior to the index date in vitiligo cases and matched controls

- Incidence: Time to first diagnosis of the relevant mental health condition in the two years following the index date in vitiligo cases and matched controls
- Primary care service utilisation: Number of primary care visits in the one year following the index date in vitiligo cases and matched controls
- Management patterns: Secondary care dermatology referrals in the one year following the index date in vitiligo cases.

2.5 Secondary endpoints

- Psychological or work-related complications consist of time of work for illness, unemployment, social phobia, adjustment disorder, substance abuse, self-harm, overdose, and parasuicide or suicide attempts
- Prevalence: A diagnosis or recording of the relevant psychological or work-related complication prior to the index date in vitiligo cases and matched controls
- Incidence: Time to first diagnosis or recording of the relevant psychological or work-related complication in the year following the index date in vitiligo cases and matched controls

3 General Study Design and Plan

3.1 Study Design

Matched-cohort design

3.2 Data source and Read codes

This study will use routinely collected and collated data from the Optimum Patient Care Research Database (OPCRD) (20). This database incorporates pseudonymised primary care records from up to 700 GP practices distributed across England, Wales, Scotland and Northern Ireland. The current OPCRD cohort size is over 5 million actively registered people, and historic records available for 10.1 million people.

3.3 Data extraction

Individual patient data is anonymised at the point of data extraction. Queries will be executed to extract relevant data from the OPCRD using the codes listed in Appendix 1.

All data will remain in anonymised form and will be held on a secure server. The data will not be used for any purposes other than for the research which is described in the respective protocols and which has been approved by OPC. The sponsor, Pfizer Ltd, will not have access to the individual anonymised patient data.

3.4 Inclusion-Exclusion Criteria and General Study Population

Definition of vitiligo cases

We will identify all people diagnosed with vitiligo using diagnostic Read and SNOMED CT codes which are specific to vitiligo (Appendix 1). A diagnostic algorithm will be used to facilitate robust case identification of vitiligo. This algorithm will identify anyone with a vitiligo specific diagnosis code followed by exclusion of anyone with a diagnosis code for an alternative depigmenting disorder coded within a one-year period (six months before or after their first vitiligo diagnosis code). The list of alternative depigmenting disorders is shown in Appendix 2.

The study index date for people diagnosed with vitiligo will be the latest of; the start date of follow-up (1st Jan 2010), date of registration with GP plus six months, or the date of diagnosis of vitiligo.

Definition of matched controls without vitiligo

Eligible controls at each index date will comprise people actively registered with the GP practice at that date without a history of vitiligo and a minimum one-year registration with their GP practice (to minimise the risk they had a non-recorded existing vitiligo diagnosis). After matching (refer to section 5.3), the index date for each control will be set at the index date of their matched counterpart. People diagnosed with vitiligo during the study period will be included in the pool of eligible unexposed people for matching, but if matched, will be censored on the date of their vitiligo diagnosis. Such people are thus eligible to contribute to the study as matched controls until the date of their vitiligo diagnosis.

Definition of mental health outcomes

We will identify three common mental health outcomes which will be examined separately; depressive episodes (DE), MDD, and non-phobia related anxiety disorder (AD),

chosen as they represent the most common mental health conditions presenting to primary care (21). Each condition will be identified using algorithms validated in UK primary care (22). The codes used to identify these conditions are provided in Appendix 3. We will use a concurrent diagnosis and treatment code to identify acute episodes (DE and AD) and for MDD either a historical code for any depression and current treatment or a depressive disorder specific diagnosis code (22). We will also identified less common mental health conditions; social phobia, adjustment disorder, substance abuse, self-harm, overdose and suicide attempt or parasuicide, using specific diagnostic codes.

Definition of psychological or work-related complications

Time-off work will be defined by the issue of Med 3 certificates of fitness for work (23), which are issued to patients to provide to their employers as evidence of being medically unable to perform usual work activities, and thus indicate absenteeism. Unemployment will be defined by the presence of a Read code relating to unemployment or issue of either an IB113 or ESA113 form to indicate incapacity from work (24). We will not evaluate whether time-off work and incapacity from work related specifically to vitiligo or mental health as this information is not available in the clinical record.

3.5 Baseline characteristics

Sociodemographic groups will be defined by 10-year age category, sex, socio-economic status (SES), and ethnicity. SES will be defined using the official national deprivation measure; index of multiple deprivation (IMD) (25). This will be calculated at the point using patient postcode, with the resultant scores stratified by deprivation quintile according to the national distribution. Ethnicity will be grouped into major ethnic groups to be consistent with the UK official census categories: White, Black African/Caribbean, Asian, Mixed, and Other (26, 27). Other clinical covariates comprised BMI category, smoking status, alcohol use, and common comorbidities (hypertension, hyperlipidaemia, type 2 diabetes, atrial fibrillation, angina, myocardial infarction, stroke, heart failure, chronic kidney disease stages 3-5, chronic obstructive pulmonary disease, asthma, chronic liver disease, and dementia). These will be identified using clinical codes and test results recorded in the patient record.

4 Sample size calculations

No previous studies have examined mental health risk in people with vitiligo to provide an estimation of effect size to inform our sample size calculation. Assuming 80% power, a 1:1 ratio of vitiligo cases to controls, and an overall probability of 15% for anxiety and 10% for depression (conservative estimates based on a previous analysis of DSM_IV disorders) in the general population (21) a sample size of between 3,350 and 5,023 will be required to detect a minimum clinically relevant effect size of a 27% increased risk of a mental health condition in the vitiligo cohort compared to population controls. We anticipate c.22,500 people in our study cohort will be defined as vitiligo cases, these will be 1:1 matched to population controls providing a study cohort well in excess of this required sample size.

5 Populations to be analysed

5.1 Inclusion Criteria

All eligible adults (≥ 18) (as at date of index date) registered with GP practices contributing data to OPCRd between January 1, 2004 and December 31, 2020, are eligible for inclusion in the study. Eligible vitiligo cases will comprise all incident cases of vitiligo over the last 15 years (2004-2020).

5.2 Exclusion Criteria

People with less than 1 year of follow up available.

5.3 Matching process

Each adult with vitiligo will be 1:1 matched at their index date using, nearest neighbour matching (30) with an unaffected control (people without vitiligo prior to or during the study period). Matching variables will comprise age, sex, duration of practice registration and within primary care practice where numbers allow. After matching, the index date for each control will be set at the index date of their matched counterpart. Refer also to section 3.4 -Definition of matched controls without vitiligo.

6 Statistical Analysis

6.1 Statistical principles

The mean, standard deviation (sd) and any other statistical measures, will be reported to one decimal place. Continuous data will be summarised in the form of means, sd, median, interquartile range (IQR) and range as appropriate. Categorical data will be summarised using frequencies and proportions. Chi-squared and t-tests will be performed to compare the frequency of dichotomous variables and the values of continuous variables where relevant. 95% CIs will be reported for main effect sizes. Statistical significance will be assessed using $p < 0.05$. Actual p-values will be reported except for p-values less than 3 decimal places which will be reported as “ <0.001 ”. P-values >0.1 will be reported to one decimal place, p-values between 0.01 and 0.1 will be reported to 2 decimal places, and p-values between 0.001 and 0.01 will be reported to three decimal places.

The assessment of any associations with baseline characteristics and the primary endpoint will be assessed using Cox proportional hazards models. A standard set of features will be used in all multivariable models as listed in section 6.2.

Assumptions of statistical approaches will be assessed, and transformations used if necessary (although it is not anticipated that the data will violate model assumptions).

6.2 Primary Endpoint Analysis

Prevalence of mental health conditions

Prevalence of mental health conditions will be estimated at the index date for both cases and matched controls.

Prevalence of the three common mental health conditions (MDD, DE, and AD) in vitiligo cases will be compared to matched controls without vitiligo, overall, and by sociodemographic subgroups defined by age, sex, SES, and ethnicity. For cases and controls, prevalence will be calculated by dividing the total number of people in each cohort fulfilling the diagnostic inclusion criteria for the indicated mental health condition,

by the total number of people in each cohort. The concomitant prevalence of MDD and AD, and DE and AD, will be estimated using the same approach.

Prevalence of social phobia, adjustment disorder, substance abuse, self-harm, and suicide attempt or parasuicide will also be examined in cases and controls.

Point prevalence of vitiligo

Point prevalence of vitiligo will be used as an estimate for lifetime prevalence. We will estimate point prevalence overall and by age and sex, on 31 December, 2020, the last date of follow-up. Point prevalence will be calculated by dividing the total number of actively registered people with a vitiligo diagnostic code (at any prior time point) by the total number of actively registered people in OPCR. New episodes or recurrent episodes of vitiligo in those already coded as vitiligo will be excluded. All people will be included regardless of the date of vitiligo diagnosis in relation to the date of registration with a practice. People with <365 days of follow up from date of registration will be excluded from the analysis.

Incidence of new onset mental health conditions

Incidence of new onset mental health conditions will be assessed prospectively in vitiligo cases and matched controls from the index date. Only case and control pairs who both are without the relevant mental health condition at the index date will be included. We will then estimate incidence rates for each common mental health conditions within two years of the index date for both vitiligo cases and controls, overall by sociodemographic subgroups defined by age, sex, SES and ethnicity.

The end of follow-up will be defined as the earliest of the study end-date (December 31, 2020), the date of patient transfer from an included general practice, date of death, or the date an individual first developed a mental health condition of interest, or two years after the index date.

Incidence will be calculated by dividing the number of incident people by the sum of person-years of follow-up. Risk of developing each mental health condition will then be examined using time to failure analysis. Initially, unadjusted Cox proportional hazards models, stratified by matched set (vitiligo cases versus matched controls), will be used to provide overall hazard ratios (HRs) as summary estimates for the association of the presence of vitiligo with the time to each mental health condition category. Models will be subsequently adjusted for sociodemographic features (age, sex, SES, and ethnicity) and common comorbidities (hypertension, hyperlipidaemia, type 2 diabetes, atrial fibrillation, angina, myocardial infarction, stroke, heart failure, chronic kidney disease stages 3-5, chronic obstructive pulmonary disease, asthma, chronic liver disease, and dementia) in multivariable analysis.

Healthcare utilisation and management patterns

We will prospectively examine primary care visit frequency and secondary care dermatology referral rates within one year of index date in the subset of vitiligo cases and matched controls, comprising of those individuals with a prevalent depressive illness or anxiety disorder at their index date using Cox proportional hazards models adjusted for sociodemographic factors (age, sex, SES, and ethnicity) and common comorbidities (hypertension, hyperlipidaemia, type 2 diabetes, atrial fibrillation, angina, myocardial infarction, stroke, heart failure, chronic kidney disease stages 3-5, chronic obstructive pulmonary disease, asthma, chronic liver disease, and dementia).

We will also report the overall primary care visit frequency and secondary care referral rate for comparison.

6.3 Secondary Objective Analysis

Time off work and unemployment

Risk of either being issued a time-off work certificate or having a record of unemployment in the one year following the index date will be examined in people of normal working age (18-65) using time to failure analysis. For each outcome, proportions will be

estimated as the cumulative one-year incidence using the Kaplan-Meier method, which will allow for differential follow-up time as not all people had a full year of follow-up available. Adjusted Cox models (same covariate set as for mental health outcomes) will be used to estimate the relative association of the presence of vitiligo with issue of Med3 certificate and unemployment.

6.4 Sensitivity analysis

To evaluate the magnitude of potential bias from including, as matched controls, people who are registered with GP practices but who do not attend their practice, we will repeat the primary analysis including only controls with a least one primary care consultation in the year preceding their index date.

6.5 Missing data

This study will use the missing indicator variable method as missing data are considered likely not to be missing at random, meaning multiple imputation approaches will lack validity.

Patient will need to be excluded from analyses based on a matched design if they have incomplete data in the fields (age, sex) required to run the matching process. In similar studies, the exclusion rate due to incomplete data has been low (28, 29).

7 Study Limitations

Although the data is derived from a validated and nationally representative sample of the UK, results should not be extrapolated to dissimilar populations. Important limitations of the study include the reliance on comprehensive code lists to identify any given baseline or outcome variable. This limitation is common to all studies using routinely recorded data and will be mitigated through the use of a validated approach for defining baseline and outcome parameters. (30)

Limitations exist in the amount of clinical detail presently recorded in routine primary care electronic health records. Routine primary care databases offer the benefit of large

cohorts at the expense of granularity; a limitation that is universal in epidemiological studies of this type. Some analyses will be restricted to people in whom complete information is available which may introduce selection bias as a result. Finally, the data presented will be observational in nature and although attempts will be made to reduce confounding by statistical adjustment where relevant, it is not possible to exclude the possibility of residual confounding as part of the explanation for any findings.

8 Statistical software

All statistical analyses will be performed using R software version 3.4.1.

9 Ethics

This study requires approval by the Anonymised Data Ethics Protocols and Transparency (ADEPT) Committee. It has been uploaded to ClinicalTrials.gov.

This study will be conducted in accordance with legal and regulatory requirements, as well as with scientific purpose, value, and rigor and follow generally accepted research practices described in Guidelines for Good Pharmacoepidemiology Practices (GPP) issued by the International Society for Pharmacoepidemiology (ISPE), and Good Epidemiological Practice (GEP) guidelines issued by the International Epidemiological Association (IEA). Study reporting will be conducted in accordance with the RECORD (Reporting of studies conducted using observational routinely collected data) guidelines.(31)

80941006		Subcutaneous sarcoidosis (disorder)
870334009		Palmoplantar sarcoidosis (disorder)
238678009		Chronic skin sarcoidosis (disorder)
238677004		Maculopapular sarcoidosis (disorder)
402368008		Ichthyosiform sarcoidosis (disorder)
402373002		Hypomelanotic sarcoidosis (disorder)
9529007		Sarcoidosis, erythrodermic type (disorder)
72470008		Sarcoidosis, lupus pernio type (disorder)
402372007		Subcutaneous nodular sarcoidosis (disorder)
238675007		Sarcoidosis-induced erythema nodosum (disorder)
238676008		Lofgrens syndrome (disorder)

31541009		Lupus pernio of Besnier
231799005		Sarcoid skin of eyelid (disorder)

Appendix 2

Potential differential diagnoses for vitiligo which will be used as exclusion criteria if they appear as diagnoses in the medical record within six months of the initial diagnosis of vitiligo (six months before or after the vitiligo diagnosis). *As these conditions are extremely uncommon in the UK they will not be used in the exclusion process. Codes for these conditions are listed in Appendix 1.

Condition group	Conditions/causes included
Congenital and genetic hypomelanoses	Piebaldism Tuberous sclerosis Hypomelanosis of Ito Waardenburg syndrome Hermanski-Pudlak syndrome Griscelli syndrome Menkes syndrome
Post-inflammatory hypomelanoses	Post-inflammatory leukoderma including after Atopic eczema or Psoriasis Lichen planus Pityriasis alba Lichen sclerosus
Post traumatic leukoderma	Post traumatic leukoderma
Para-malignant hypomelanoses	Cutaneous T-cell lymphoma (mycosis fungoides) Melanoma associated depigmentation
Occupational/drug induced hypomelanoses	Occupational vitiligo Other induced hypomelanoses
Para-infectious hypopigmentation	Pityriasis versicolor (or tinea versicolor) <i>Leprosy*</i> <i>Leishmaniasis*</i>
Others	Melasma Morphoea Idiopathic guttate hypomelanosis Xeroderma pigmentosum Progressive macular hypomelanosis Nevus depigmentosus Cutaneous sarcoidosis

Appendix 3

Read and SNOMED codes to be used to identify mental health conditions and related clinical entities (mental health symptoms and treatments) used to correctly identify people with mental health conditions. The full algorithms used to identify these conditions are described elsewhere (22).

720452006		Moderately severe recurrent major depression (disorder)
720453001		Moderately severe major depression single episode (disorder)
720454007		Minimal major depression single episode (disorder)
720455008		Minimal major depression (disorder)
723928009		Mood disorder with depressive symptoms caused by alcohol (disorder)
723930006		Mood disorder with mixed manic and depressive symptoms caused by alcohol (disorder)
724676000		Mood disorder with depressive symptoms caused by sedative (disorder)
724677009		Mood disorder with depressive symptoms caused by hypnotic (disorder)
724678004		Mood disorder with depressive symptoms caused by anxiolytic (disorder)
724690002		Mood disorder with depressive symptoms caused by cocaine (disorder)
724757005		Depressive symptoms due to primary psychotic disorder (disorder)
726772006		Major depression with psychotic features (disorder)
762321000		Mood disorder with depressive symptoms caused by opioid (disorder)
762329003		Mood disorder with depressive symptoms caused by stimulant (disorder)
762336002		Mood disorder with depressive symptoms caused by hallucinogen (disorder)
762339009		Mood disorder with depressive symptoms caused by volatile inhalant (disorder)
762512002		Mood disorder with depressive symptoms caused by synthetic cathinone (disorder)
768835002		Depression care management (procedure)

788120007		Antenatal depression (disorder)
838529004		Mood disorder with mixed depressive and manic symptoms caused by amphetamine and amphetamine derivative (disorder)
871840004		Episode of depression (finding)
251000119105		Severe major depression, single episode (disorder)
281000119103		Severe recurrent major depression (disorder)
10211000132109		Perinatal depression (disorder)
94631000119100		Depressive disorder in mother complicating pregnancy (disorder)
133121000119109		Severe seasonal affective disorder (disorder)
142001000119106		Depressed mood in Alzheimers disease (disorder)
199111000000100		Referral for guided self-help for depression (procedure)
286711000000107		Counseling for depression (procedure)
288751000119101		Reactive depressive psychosis, single episode (disorder)
361761000000106		On full dose long term treatment for depression (finding)
755321000000106		Single major depressive episode, severe, with psychosis, psychosis in remission (disorder)
755331000000108		Recurrent major depressive episodes, severe, with psychosis, psychosis in remission (disorder)
764611000000100		Recurrent major depressive episodes, severe (disorder)
764691000000109		Recurrent major depressive episodes, in partial remission (disorder)
764701000000109		Recurrent major depressive episodes, in remission (disorder)
764711000000106		Single major depressive episode, in remission (disorder)
923921000000104		Referral for depression self-help video (procedure)
1086471000000100		Recurrent reactive depressive episodes, severe, with psychosis (disorder)
1086661000000100		Reactive depression, prolonged single episode (disorder)
1086671000000100		Reactive depression, single episode (disorder)
1086681000000100		Reactive depression, recurrent (disorder)
1086691000000100		Reactive depression, first episode (disorder)
1089511000000100		Recurrent depression with current severe episode and psychotic features (disorder)
1089631000000100		Recurrent depression with current severe episode without psychotic features (disorder)
1089641000000100		Recurrent depression with current moderate episode (disorder)
10811121000119100		Major depressive disorder in mother complicating childbirth (disorder)
10811161000119100		Major depressive disorder in mother complicating pregnancy (disorder)
10835871000119100		Depressive disorder in mother complicating childbirth (disorder)
16238181000119100		Depressive disorder caused by amphetamine (disorder)
16238221000119100		Depressive disorder caused by methamphetamine (disorder)
16264621000119100		Recurrent mild major depressive disorder co-occurrent with anxiety (disorder)
16264821000119100		Recurrent severe major depressive disorder co-occurrent with anxiety (disorder)
16264901000119100		Recurrent moderate major depressive disorder co-occurrent with anxiety (disorder)
16265301000119100		Recurrent major depressive disorder in partial remission co-occurrent with anxiety (disorder)
16265951000119100		Mild major depressive disorder co-occurrent with anxiety single episode (disorder)
16266831000119100		Moderate major depressive disorder co-occurrent with anxiety single episode (disorder)
16266991000119100		Severe major depressive disorder co-occurrent with anxiety single episode (disorder)

Appendix 4

Below is a list of the variables to be extracted and utilised for the study

Variable	Role	Data source(s)	Operational definition
Vitiligo	Case definition	OPCRD	As defined using the codes listed in Appendix 1
Vitiligo exclusion conditions	Case definition	OPCRD	As defined using the codes listed in Appendix 1 and summarised in Appendix 2
Depressive episode	Primary outcome variable	OPCRD	Identified from coding in the clinical record
Recurrent depressive disorder	Primary outcome variable	OPCRD	Identified from coding in the clinical record
Non-phobia related anxiety disorder	Primary outcome variable	OPCRD	Identified from coding in the clinical record
Social phobia	Secondary outcome variable	OPCRD	Identified from coding in the clinical record
Adjustment disorder	Secondary outcome variable	OPCRD	Identified from coding in the clinical record
Substance abuse	Secondary outcome variable	OPCRD	Identified from coding in the clinical record
Self-harm	Secondary outcome variable	OPCRD	Identified from coding in the clinical record
Suicide attempt	Secondary outcome variable	OPCRD	Identified from coding in the clinical record
Parasuicide	Secondary outcome variable	OPCRD	Identified from coding in the clinical record
Primary care visit	Secondary outcome variable	OPCRD	Identified from coding in the clinical record
Secondary care dermatology referral	Secondary outcome variable	OPCRD	Identified from coding in the clinical record
Med 3 certificates	Secondary outcome variable	OPCRD	Identified from coding in the clinical record
Unemployment	Secondary outcome variable	OPCRD	Identified from coding in the clinical record
Age	Baseline characteristic, predictor variable	OPCRD	Defined as age at the start of follow up
Gender	Baseline characteristic, predictor variable	OPCRD	Primary care recorded patient gender

Variable	Role	Data source(s)	Operational definition
Socioeconomic status (SES)	Baseline characteristic, predictor variable	OPCRD	Defined using patient index of multiple deprivation quintile
Ethnicity	Baseline characteristic, predictor variable	OPCRD	Defined using office of national statistics census categories using clinically coded ethnicity data
Smoking status	Baseline characteristic, predictor variable	OPCRD	Using most recent clinically recorded smoking status information
Alcohol use	Baseline characteristic, predictor variable	OPCRD	Using most recent clinically recorded alcohol use status information
Body mass index (BMI)	Baseline characteristic, predictor variable	OPCRD	Defined using most recent clinically recorded BMI information
Death	Censoring event	OPCRD	Identified from coding in the clinical record
Deregistration from GP	Censoring event	OPCRD	Identified from coding in the clinical record
Atrial fibrillation	Baseline characteristic, predictor variable	OPCRD	Identified using clinical codes for the condition
Angina	Baseline characteristic, predictor variable	OPCRD	Identified using clinical codes for the condition
Myocardial infarction	Baseline characteristic, predictor variable	OPCRD	Identified using clinical codes for the condition
Congestive heart failure	Baseline characteristic, predictor variable	OPCRD	Identified using clinical codes for the condition
Stroke	Baseline characteristic, predictor variable	OPCRD	Identified using clinical codes for the condition
Diabetes type	Baseline characteristic, predictor variable	OPCRD	Identified using clinical codes for the condition
Hyperlipidaemia	Baseline characteristic, predictor variable	OPCRD	Identified using clinical codes for the condition
Hypertension	Baseline characteristic, predictor variable	OPCRD	Identified using clinical codes for the condition

Variable	Role	Data source(s)	Operational definition
Chronic kidney disease stages 3-5	Baseline characteristic, predictor variable	OPCRD	Identified using clinical codes for the condition and lab test results
Chronic obstructive pulmonary disease	Baseline characteristic, predictor variable	OPCRD	Identified using clinical codes for the condition
Asthma	Baseline characteristic, predictor variable	OPCRD	Identified using clinical codes for the condition
Chronic liver disease	Baseline characteristic, predictor variable	OPCRD	Identified using clinical codes for the condition
Dementia	Baseline characteristic, predictor variable	OPCRD	Identified using clinical codes for the condition
