## 2. Abstract

This is a non-randomized, non-interventional study that is part of the *Randomized Controlled Trials Duplicated Using Prospective Longitudinal Insurance Claims: Applying Techniques of Epidemiology* (RCT-DUPLICATE) initiative ([www.rctduplicate.org](http://www.rctduplicate.org)) of the Brigham and Women's Hospital, Harvard Medical School. It is intended to emulate, as closely as possible in healthcare insurance claims data, the SUSTAIN6 trial described below. Although many features of the trial cannot be directly replicated in healthcare claims, key design features, including outcomes, exposures, and inclusion/exclusion criteria, were selected to proxy those features from the trial. Randomization cannot be emulated in healthcare claims data but was proxied through a statistical balancing of measured covariates according to standard practice. Investigators assume that the RCT provides the reference standard treatment effect estimate and that failure to replicate RCT findings is indicative of the inadequacy of the healthcare claims data for emulation for a range of possible reasons and does not provide information on the validity of the original RCT finding.

The SUSTAIN6 trial is a non-inferiority trial to evaluate the effect of injectable semaglutide, a glucagon-like peptide-1 receptor agonist (GLP-1-RA), versus placebo on time to first occurrence of any major adverse cardiovascular event (MACE), defined as cardiovascular death, myocardial infarction, or stroke among patients with type 2 diabetes mellitus (T2DM).

The database study designed to emulate SUSTAIN6 trial will be a new-user active comparative study, where we compare the effect of injectable semaglutide versus sitagliptin on MACE outcome among patients with T2DM. Sitagliptin was selected to act as an active-comparator proxy for placebo. Sitagliptin and the class of dipeptidyl peptidase-4 (DPP-4) inhibitors have been demonstrated not to have an effect on MACE in a series of RCTs, and they are used in similar stages of disease/line of therapy as semaglutide, as well as being of similar cost.

The study will use three data sources: Optum Clinformatics, Merative MarketScan, and Medicare.

Optum: Study period between January 1, 2018 to February 28, 2025.

MarketScan: Study period between January 1, 2018 to December 31, 2023.

Medicare: Study period between January 1, 2018 to December 31, 2020.

### 3. Amendments and updates

Version date	Version number	Section of protocol	Amendment or update	Reason
24 <sup>th</sup> July 2025	1	All sections	<p>This version of the emulation of SUSTAIN-6 is part of a 3-stage study that aims to compare tirzepatide vs semaglutide in patients at cardiovascular risk with type 2 diabetes and obesity. This project builds on a protocol for emulating SUSTAIN6 that was developed for a different project with a different objective. The changes include:</p> <ul style="list-style-type: none"> <li>• Extending cohort entry and follow up to include data up to February 28, 2025 in Optum data</li> <li>• Adding additional secondary outcomes (including individual components of the primary endpoint)</li> <li>• Adding additional variables to the propensity score to address confounding for added outcomes</li> <li>• Changing assessment windows for various design elements (e.g., covariate assessment window, eligibility criteria) of the study</li> </ul>	<p>This project builds on a version of an emulation of SUSTAIN-6 that was conducted for different objectives than this study. This protocol includes updates to align the study design with other components of the 3-stage study. Differences in results between the versions of SUSTAIN emulations may occur due to the differences in objectives and design/implementation.</p>

4. Rationale and background

The purpose of this protocol is to describe the emulation of the SUSTAIN6 trial ([NCT01720446](#)). The trial enrolled 3,297 participants between February and December 2013. The trial design is event-driven to collect 122 events, which assumes an annual 1.98% event rate in both arms over 2.1 years, which would result in 90% power, to reject a 1.8 hazard ratio at a significance level of 0.05 to assess non-inferiority.<sup>1,2</sup>

Injectable semaglutide became available on December 5, 2017 under the brand name Ozempic.<sup>3</sup> On January 16, 2020, the approval was expanded to include cardiovascular risk reduction in adults with type 2 diabetes mellitus and known heart disease. On March 28, 2022, Novo Nordisk received FDA approval for a higher-dose semaglutide (2 mg) to provide improved glycemic control for adults with T2DM. Meanwhile, semaglutide received its first FDA approval for the treatment of obesity in adults under the brand name Wegovy on June 4, 2021. On December 23, 2022, the approval was extended to include teenagers aged 12 and older. Later, on March 8, 2024, Wegovy was additionally approved for cardiovascular risk reduction in people with overweight or obesity and established cardiovascular disease. Most recently, on January 28, 2025, Ozempic became the first and only GLP-1-RA approved to reduce the risk of worsening kidney disease and cardiovascular death in adults with Type 2 diabetes and chronic kidney disease.

Sitagliptin was specifically chosen as an active comparator that could proxy for placebo because a major randomized controlled trial on cardiovascular outcomes demonstrated that it does not affect the cardiovascular outcomes under investigation.<sup>4</sup> This contrasts with other DPP4i such as saxagliptin, which has raised concerns regarding potential increased risks of heart failure,<sup>5-8</sup> and linagliptin, which is commonly prescribed for patients with renal impairment because it does not require dose modifications based on kidney function, potentially leading to increased confounding compared to sitagliptin.<sup>9,10</sup> Sodium-glucose cotransporter-2 (SGLT2) inhibitors would not be a neutral comparator, as they significantly reduce clinically important kidney events, kidney failure, and cardiovascular events.<sup>11-14</sup> Sulfonylureas (SUs), though inexpensive and widely used, are a poor comparator in cardiovascular outcome studies due to their association with hypoglycemia, weight gain, and channeling bias, as they are often prescribed to elderly, lower socioeconomic status patients with higher baseline cardiovascular risk, making direct comparisons to GLP-1-RAs less reliable.<sup>15</sup>

5. Research question and objectives

Table 1 Primary and secondary research questions and objective

A. Primary research question and objective

Objective:	To evaluate the effect of injectable semaglutide versus sitagliptin on MACE outcomes (CV death, nonfatal MI, or nonfatal stroke) in patients with diabetes and established or subclinical CV disease.
------------	---

<b>Hypothesis:</b>	We hypothesize that semaglutide will be superior to sitagliptin at preventing MACE.
<b>Population (mention key inclusion-exclusion criteria):</b>	Individuals with T2DM, who are either aged 50 years or above with an established cardiovascular disease, or aged 60 years or above with a subclinical cardiovascular disease.
<b>Exposure:</b>	Injectable Semaglutide.
<b>Comparator:</b>	Sitagliptin.
<b>Outcome:</b>	Major adverse cardiac event (MACE), including myocardial infarction, stroke, and all cause death.
<b>Time (when follow up begins and ends):</b>	One day after cohort entry date until the first of outcome, disenrollment, end of study period, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between the arms, start of any other GLP1 agonists (including oral Semaglutide), Other DPP4 or Pramlintide, Nursing home admission.
<b>Setting:</b>	Patients may be treated in outpatient settings. The outcome will be measured from inpatient hospitalizations and/or death.
<b>Main measure of effect:</b>	Hazard ratio.

## B. Secondary research questions and objectives

<b>Objective:</b>	To evaluate the effect of injectable semaglutide versus sitagliptin on the individual components of the primary endpoint, i.e., all-cause mortality, myocardial infarction, or stroke in patients meeting the eligibility criteria of the SUSTAIN-6 trial.
<b>Hypothesis:</b>	We hypothesize that semaglutide will be superior to sitagliptin at preventing all-cause mortality, myocardial infarction, or stroke.
<b>Population (mention key inclusion-exclusion criteria):</b>	Individuals with T2DM, who are either aged 50 years or above with an established cardiovascular disease, or aged 60 years or above with a subclinical cardiovascular disease.
<b>Exposure:</b>	Injectable semaglutide.
<b>Comparator:</b>	Sitagliptin.
<b>Outcome:</b>	The individual components of the primary endpoint, i.e., all-cause mortality, myocardial infarction, and stroke.

<b>Time (when follow up begins and ends):</b>	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between the arms, start of any other GLP1 agonists (including injectable semaglutide).
<b>Setting:</b>	The outcome will be measured from inpatient hospitalizations and death.
<b>Main measure of effect:</b>	Hazard ratio.

<b>Objective:</b>	To evaluate the effect of injectable semaglutide versus sitagliptin on negative control outcomes, including (1) hernia and (2) lumbar radiculopathy.
<b>Hypothesis:</b>	We hypothesize that semaglutide will not have a different effect than sitagliptin.
<b>Population (mention key inclusion-exclusion criteria):</b>	Individuals with T2DM, who are either aged 50 years or above with an established cardiovascular disease, or aged 60 years or above with a subclinical cardiovascular disease.
<b>Exposure:</b>	Injectable semaglutide.
<b>Comparator:</b>	Sitagliptin.
<b>Outcome:</b>	Separate analyses were run for hernia and lumbar radiculopathy.
<b>Time (when follow up begins and ends):</b>	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, death, 365 days after cohort entry date, discontinuation (45 days grace and risk window), switch between the arms, start of any other GLP1 agonists (including injectable semaglutide).
<b>Setting:</b>	Patients may be treated in outpatient settings. The outcome will be measured from outpatient procedure codes.
<b>Main measure of effect:</b>	Hazard ratio.

## 6. Research methods

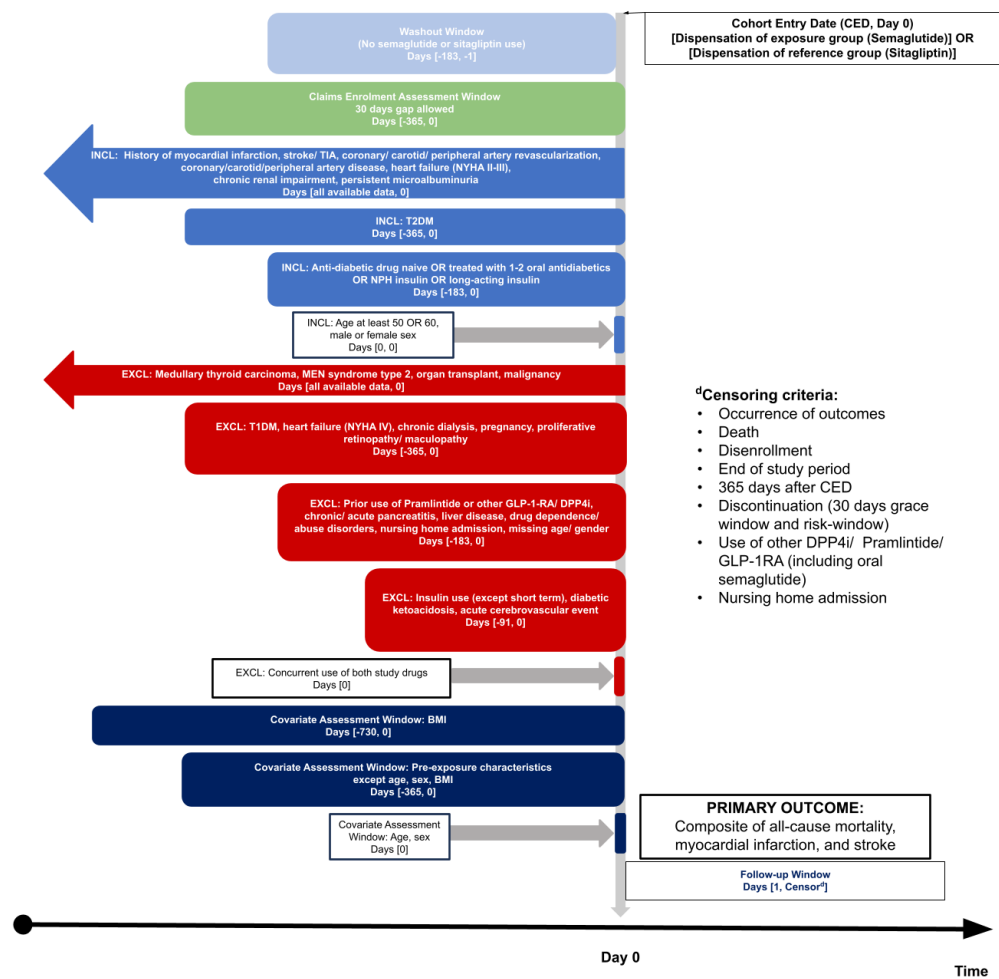

### 6.1 Study design

Research design (e.g. cohort, case-control, etc.): New user active comparator cohort study.

Rationale for study design choice: A new user active comparator cohort study is a powerful design that may be able to address confounding by indication. It accomplishes this, in large part, through judicious selection of an appropriate active-comparator group.<sup>[16,17](#)</sup> While selection of an appropriate comparator in the design phase is crucial, cohort studies often require additional adjustment of measurable confounders. A common method for adjusting for confounding is via a propensity score (PS).

6.2 Study design diagram when following the eligibility criteria of the SUSTAIN-6 trial (Figure 1).

Figure 1. Exposure-based cohort entry where the cohort entry date is selected after application of exclusion criteria

## 6.3 Setting

### 6.3.1 Context and rationale for definition of time 0 (and other primary time anchors) for entry to the study population

Time 0 in the database study was defined to emulate randomization to treatment with injectable semaglutide versus sitagliptin in the clinical trial design. See appendix tables 1 and 2 for operational definitions and detailed code algorithms.

### 6.3.2 Context and rationale for study inclusion criteria:

Study inclusion criteria were defined to emulate the inclusion criteria for the trial. See appendix tables 1 and 2 for operational definitions and detailed code algorithms. A flowchart of the study cohort assembly is provided in Appendix 3.

### 6.3.3 Context and rationale for study exclusion criteria

Study exclusion criteria were defined to emulate the exclusion criteria for the trial. See appendix tables 1 and 2 for operational definitions and detailed code algorithms. A flowchart of the study cohort assembly is provided in Appendix 3.

## 6.4 Variables

### 6.4.1 Context and rationale for exposure(s) of interest

The exposure and comparator were defined to emulate the agents compared for the trial, Injectable Semaglutide versus Sitagliptin. See appendix tables 1 and 2 for operational definitions and detailed code algorithms.

#### **Algorithm to define duration of exposure effect:**

Assuming the effect of pill lasts for 45 days after the days' supply, we allow 45 days gap between the dispensation (grace period) and also add 45 days at the end of days' supply of dispensation (exposure risk window).

### 6.4.2 Context and rationale for outcome(s) of interest

The primary outcome for the database study was defined to emulate the primary outcome of the trial, i.e., MACE (composite of cardiovascular death, myocardial infarction, or stroke). Due to the inability to capture cause of death in our emulation, we modified the MACE outcome to capture all-cause mortality, myocardial infarction, or stroke. See appendix tables 1 and 2 for operational definitions and detailed code algorithms. Optum includes death information from the inpatient discharged dead status, social security death master file, and deaths scraped from obituaries or other sources. MarketScan includes information from the inpatient discharged dead status as well as social security death master file. Medicare includes information from the inpatient discharged dead status, NDI cause of death, and social security death master file. The positive predictive value for the myocardial infarction outcome algorithm using ICD-9 codes was observed to be 88.4% and 94% in validation studies.<sup>18,19</sup> The PPV for the ischemic stroke outcome algorithm was 95% in a validation study using ICD9 codes.<sup>18</sup> The ICD9 code algorithms were mapped to ICD10 codes and reviewed by a clinician, but the performance of the mapped codes was not further validated.

Secondary outcomes from the trial that will be evaluated include:

1. Individual components of the primary endpoint, i.e., all-cause mortality, myocardial infarction, and stroke.

Control outcomes of interest include:

1. Hernia (excluding patients with recent outcome prior to the follow-up time window). This is a negative control outcome where no difference in effect is expected for tirzepatide vs dulaglutide.
2. Lumbar radiculopathy (excluding patients with recent outcome prior to the follow-up time window). This is a negative control outcome where no difference in effect is expected for tirzepatide vs dulaglutide.

### 6.4.3 Context and rationale for follow up

Both on-treatment (OT) and intention-to-treat (ITT) analyses will be conducted. Adherence in clinical practice databases is expected to be much worse than in the trial, therefore the OT analysis will be the primary analysis. The OT analysis targets the relative hazard of outcomes while on treatment and may more closely emulate the effect observed in highly adherent trial participants. Both OT and ITT analyses will be conducted with up to 1-year follow-up.

**Table 2. Operational Definitions of Follow Up**

<b>Follow up start</b>	Day 1	
<b>Follow up end<sup>1</sup></b>	<b>Select all that apply</b>	<b>Specify</b>
<b>Date of outcome</b>	Yes	
<b>Date of death</b>	Yes	Part of the outcome
<b>End of observation in data</b>	Yes	Date of disenrollment
<b>Day X following index date</b> (specify day)	Yes	Day 365
<b>End of study period</b> (specify date)	Yes	Dates for different databases (Optum: February 28, 2025, Marketscan December 31, 2023, Medicare December 31, 2020)
<b>End of exposure</b> (specify operational details, e.g. stockpiling algorithm, grace period)	Yes	45 days grace window and 45 days risk window
<b>Date of add to/switch from exposure</b> (specify algorithm)	Yes	Date of augmentation or switching from an exposure to a comparator and vice versa.
<b>Other date</b> (specify)	Yes	Censor upon starting any other GLP1 agonists, including oral semaglutide, other DPP4 inhibitors or pramlintide, nursing home admission

<sup>1</sup> Follow up ends at the first occurrence of any of the selected criteria that end follow up.

#### 6.4.4 Context and rationale for covariates (confounding variables and effect modifiers, e.g. risk factors, comorbidities, comedications)

We identified a series of covariates that were likely confounders due to being strong risk factors for the primary outcome that were associated with choice of treatment. These include demographics, disease severity related variables, comorbid conditions, comedications, frailty, healthcare utilization and markers of health seeking behaviour.

## 6.5 Data analysis

### 6.5.1 Context and rationale for analysis plan

The study will use a propensity score (PS) 1:1 nearest neighbor matching with a caliper of 0.01 on the propensity score scale. The PS will be estimated as the probability of initiating injectable semaglutide versus sitagliptin given the baseline patient characteristics using multivariable logistic regression models. As diagnostics for PS models, the study will evaluate distributional covariate balance using standardized differences and c-statistics post-matching. The study will estimate the hazard ratio for injectable semaglutide versus Sitagliptin inhibitor on MACE outcome in the matched population using a Cox proportional hazards model.

**Table 4. Primary, secondary, and subgroup analysis specification**

	What is being varied? How?	Why? (What do you expect to learn?)	Strengths of the sensitivity analysis compared to the primary	Limitations of the sensitivity analysis compared to the primary
Negative control outcomes, including hernia, lumbar radiculopathy	We evaluate negative control outcomes of hernia and lumbar radiculopathy, where no causal effect is expected from tirzepatide, or dulaglutide.	We will evaluate the potential impact of residual confounding on this outcome for which there is not expected to be a causal effect	The evaluates the robustness of the interpretation of the primary analysis by evaluating the potential magnitude of unmeasured confounding	This analysis assumes that the confounding structure is the same or similar for the negative control outcome as the outcome of interest
Effect estimation in individuals with HbA1c measurement.	The population will be restricted to individuals with a HbA1c measurement in the 120 days before cohort entry.	To assess the impact of restricting to individuals with HbA1c measurement and including HbA1c in the PS model.	Includes baseline glycemic information as captured in laboratory HbA1c measurements.	This approach highly restricts the number of eligible individuals under study and thereby the statistical power of the analysis.
As-started analyses (observational analogue to intention-to-treat) to address potential informative censoring.	To address potential informative censoring.	We will consider the first-used medication for 365 days without considering drug discontinuation or switching, mimicking an “intention-to-treat” approach.	Reflects follow-up regimen of RCT.	Persistence of drug use is shorter in clinical practice whereas adherence is typically higher in RCTs. Therefore, we expect the estimated effects will be diluted toward the null, underestimating the true treatment effect had patients remained on therapy.

### 6.5.2 Comparison of Results Between Database Studies and RCTs

We will attempt to benchmark the results of the secondary analysis from the database study against the composite end point of MACE observed in the SUSTAIN-6 trial. It is important to note that this end point had few outcomes in the trial. Consequently, failure to replicate the RCT findings is not necessarily indicative of the inadequacy of the healthcare claims data for emulation for a range of possible reasons, nor does failure to replicate provide information about the validity of the trial result.<sup>23</sup> Assessment of concordance in results between the database study-trial pair will use the

metrics previously implemented in the RCT-DUPLICATE initiative, namely statistical significance agreement, estimate agreement, and standardized difference agreement. In this project, “full” statistical significance agreement was defined by estimates and confidence intervals on the same side of null; estimate agreement was defined by whether estimates for the trial emulation fell within the 95% CI for the trial results; standardized difference agreement between treatment effect estimates from trials and emulations was defined by standardized differences  $|Z| < 1.96$  ( $Z = \frac{(\theta_{RCT} - \theta_{RWE})}{(\sqrt{\hat{\sigma}_{RCT}^2 + \hat{\sigma}_{RWE}^2})}$  where  $\theta$  are the treatment effect estimates and the  $\hat{\sigma}^2$  are associated variances). In addition, “partial” significance agreement was defined as meeting pre-specified non-inferiority criteria even though a more highly powered database study may have indicated superiority.<sup>23,24</sup>

## 6.6 Data sources

### 6.6.1 Context and rationale for data sources

Reason for selection: The study will be conducted in 3 US health care claims databases: Optum Clinformatics (2018-Feb 2024), Merative Marketscan (2018-2022) and Medicare (a sample that includes all patients with diabetes or heart failure diagnosis, 2018-2020)

Strengths of data source(s): Each data source contains deidentified, longitudinal, date-stamped information on patient enrollment, demographics, inpatient/outpatient diagnosis and procedures, admission and discharge dates, and medication dispensation. The death data is captured in the Optum database from inpatient discharge status, social security death master file, and deaths scraped from obituaries or other sources. The death data in MarketScan is captured from the social security death master file and inpatient discharge status. . It is recognized that the social security death master file has high specificity and positive predictive value for deaths. While this data resource has under captured deaths since 2011, the capture of deaths is not expected to be differential between compared exposure groups. The death data is captured in the Medicare database from inpatient discharge status, and social security death master file.<sup>25-27</sup>

Limitations of data source(s): Patient healthcare encounters are only observable when they are enrolled in an insurance plan that contributes to the database. Patients may change insurance plans for multiple reasons. Both Optum Clinformatics and Merative MarketScan are primarily employer based insurance databases where patients may disenroll with job changes. Patients in Medicare may move in and out of fee-for-service plans. We are excluding person-time in health maintenance organization (HMO) plans due to concerns about the completeness of capture of diagnoses and procedures. This means that we require patients to be enrolled in Medicare parts AB and D during the baseline assessment window and censor patients if they switch to part C. In claims data, dispensing data for inpatient medication is unavailable. Diagnoses reflect billing practices, therefore algorithms (preferably validated) are needed for accurate phenotyping of patient conditions. Services that are not covered by insurance do not appear in the data. The trial evaluated cardiovascular deaths, however we will evaluate all cause death in the emulation because most deaths in this cohort of patients at high cardiovascular risk will be related to cardiovascular reasons, the cause of death is not recorded for databases not linked to NDI, and the performance of NDI at identifying cardiovascular causes of death may be suboptimal.<sup>27</sup>

Data source provenance/curation: Information about Optum Clinformatics and Merative MarketScan can be found in data dictionaries and user guides that are provided to clients. Information about Medicare data provenance and curation can be found on the ResDac website.<sup>28</sup>

## 6.7 Data management

**Tracking data:** The Data Use Agreement (DUA) Custodian (Principal Investigator) and the Division Operations Manager (Winta Tekle) are responsible for receiving and creating a record of new data associated with the given request. The Operations Manager is responsible for all indexing and archiving of documents and electronic media related to data that the Division receives and will log data location, data contents, and associated DUA and Institutional Review Board (IRB) numbers in the Division's centralized tracking system.

**Handling and storage:** In-scope data will be stored utilizing Mass General Brigham approved information systems – i.e., Division servers and Mass General Brigham network storage.

**Archiving:** Data retention and any removal will be executed by the Division Operations Manager (Winta Tekle) and Data Manager (Todd MacGarvey). The Division follows Mass General Brigham enterprise record retention policies and follow the terms of the agreement through which the in-scope data was received.

**Information security:** The Division follows Mass General Brigham's Enterprise Information Security Program (EISP). The EISP helps by providing assurance that Mass General Brigham information and information systems are protected from unauthorized access, use, disclosure, duplication, modification, or destruction in order to maintain their confidentiality, integrity, and availability. To that end, the EISP policies, standards and procedures

create an information security framework that is aligned with the recommendations of the International Organization for Standardization's (ISO) publication 27001 and the National Institute of Standards and Technology's (NIST) publication 800-53 Family of Controls and MGB regulatory and legal requirements (as a HIPAA covered entity).

Mass General Brigham workforce members are required to complete new workforce privacy and information security training upon hire and annually thereafter. Refresh training is provided as appropriate. Mass General Brigham workforce members are required to review and sign a Confidentiality Agreement upon hire and annually thereafter. Additionally, we follow Enterprise Information Security and Privacy policies, including Managing Workforce Members Information Security Responsibilities Policy, which was developed to help assure that Mass General Brigham workforce members are competent and eligible to support the information security responsibilities associated with their role. Mass General Brigham workforce, including Division staff, are required to comply with Enterprise Information Security and Privacy Policies.

Facilities: The research team uses a highly secure, state-of-the-art, computing facility housed at Mass General Brigham's Corporate Data Centers in Needham and Marlborough, Massachusetts as well as Amazon Web Services (AWS). We maintain redundant storage for maximal data integrity and high-speed data access.

The Division uses Mass General Brigham corporate provisioned servers to analyze and store data in connection with this project. There are strict access controls enforced by technical means to ensure that only study staff who have been approved to conduct data analyses and contracted data engineers are able to access data (e.g., Mass General Brigham Authentication (Active Directory) utilized; auditing, logging, and monitoring enabled; firewalls enabled; etc.). All Division servers used in this study are accessible to only authorized staff only through the MGB network and utilizing VPN as appropriate (i.e., users must be on the network and logged into VPN to access). Mass General Brigham has a network information security monitoring team and in-scope servers are enrolled in enterprise security tools (e.g., vulnerability scanning service, antivirus, etc.).

The Division also uses AWS. In-scope AWS services / resources have undergone review and assessment by Mass General Brigham's Information Security Risk Assessment Team/ InfoSec Risk Management Team as required and in alignment with NIST 800-30: Guide for Conducting Risk Assessments. In-scope AWS servers are for our exclusive use (reserved instances), are covered under our organization's Business Associate Agreement with AWS. In-scope servers are housed in anonymous facilities that are not branded as AWS facilities. Physical access is strictly controlled both at the perimeter and at building ingress points by professional security staff utilizing video surveillance, intrusion detection systems, and other electronic means.

Security attributes and controls for the Division's use of in-scope AWS in connection with this project include: encryption at rest and in transit (industry standard AES-256 encryption, SSL/TSL), anti-malware, latest OS updates and patches as well as anti-virus; multi-factor authentication (MFA), Identity and Access Management, including SSO; auditing and logging; principle of least privilege, including for traffic and ports (e.g., deny all default configurations), use of VPC enabled Step functions, etc.; separation between environments; minimum necessary (out of the box AWS roles are not used as they can be overly permissive); all data would reside in the US domestic regions – use only US east HIPAA compliant region; performance monitoring enabled and reviewed as per internal processes; passwords compliant with enterprise password policy and, as appropriate, more protective password requirements; etc. Our Division's AWS use is also subject to ongoing evaluation and monitoring as well – e.g., vulnerability scanning and management, access review, etc.

A data file list will be maintained in Amazon S3 and tracked through Cloudtrail and Cloudwatch. Reporting of data file availability for any file stored in an S3 bucket will be controlled by MGB.

Amazon EC2, Amazon EBS, and Amazon VPC are integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in Amazon EC2, Amazon EBS, and Amazon VPC. CloudTrail captures all API calls for Amazon EC2, Amazon EBS, and Amazon VPC as

events, including calls from the console and from code calls to the APIs. MGB IT/security staff have full access to CloudTrail to ensure that CloudTrail monitoring is available at all times. Amazon CloudWatch Events delivers a near-real-time stream of system events that describe changes in AWS resources. Amazon CloudTrail can log, continuously monitor, and retain account activity related to actions across the MGB AWS infrastructure. CloudTrail provides event history of MGB AWS account activity. This event history simplifies security analysis, resource change tracking, and troubleshooting and complies with requirements to ensure the data file inventory is controlled by MGB.

**Backups:** Backups are created using industry recognized Cryptographic mechanisms (e.g., 256-bit AES encryption) as appropriate and required. Data are backed up within the MGB network from the MGB Needham data center to the MGB Marlborough data center via replication/mirroring and volume-level snapshots. AWS Backup supports both instance-level backups as Amazon Machine Images (AMIs) and volume-level backups as separate snapshots based on the resource tags. AMIs allow MGB IT and security staff to create backups of all S3 and EC2 instances. This backup approach allows elimination of EC2 instances when access to CMS data files is no longer needed. Use of temporary instances will allow highest security control to be applied regarding for whom and when CMS data files are accessible.

In addition to the safeguards listed above, the Division follows enterprise privacy and information security policies and maintains internally procedures in connection with this project to safeguard the data in connection with this project as appropriate and required including: Physical Security and Environmental Controls for Electronic Information Policy; IT Access Control Standards for Users policy; Safeguarding Fax Copiers Printers Telephone Use and Pagers; Physical Removal and Transport of Protected Health Information and Personal Information policy, etc.

## **6.8. Quality control**

Senior Programmers and Research Specialists perform QA/QC on raw or common data model converted data via SAS/R/Aetion software. The protocol will be iteratively developed and pre-specified data checks including feasibility counts and balance on baseline covariates will be conducted with outputs reviewed by both MGB and FDA team members. Team members will review code lists to ensure fidelity to intended algorithms.

## **6.9. Study size and feasibility**

See appendix 4 and appendix 5 (feasibility, weighting on age, sex, comorbidity score as well as all predefined propensity score variables). Propensity score distribution plots with c-statistics are available in appendix 6. Table 1 showing prevalence of baseline characteristics and standardized differences in distribution are available in appendix 7. Additional diagnostic evaluations, including balance assessments of laboratory and clinical examination test results not included in the propensity score as well as assessment of heart failure-related medication after follow-up, will be conducted to assess potential residual confounding and divergence of treatment over time.

## **7. Limitation of the methods**

As we are using secondary data and the data were not collected for research, some important variables may not be collected or will be measured imperfectly. We have selected validated algorithms when possible and we have created proxies for important variables that are not directly captured in the data to reduce confounding by unmeasured factors. One measurement difference is for the primary outcome, where for the RCT, MACE was defined as stroke, myocardial infarction, and cardiovascular death, whereas in our database study, it is defined as stroke, myocardial infarction, and all cause death.

When comparing results from an RCT to a database study that emulates the design, we assume that the findings from the single RCT are internally valid.

Although we plan to emulate the important features of each RCT as closely as possible in healthcare claims, there may be some elements of RCT design that are not emulable with a database study, which means that the study generating RWE and the RCT will address slightly different clinical questions. For example, in routine clinical practice, adherence to treatment is typically not as high as it is in an RCT with strong measures in place to encourage adherence to the study protocol. This means that there is more discontinuation and short-term medication use in the patients identified in claims databases than trial participants.

Apparent agreement between RCT and database study results could occur if the effects of multiple factors (chance, emulation differences, bias) cancel each other out.

## 8. Protection of human subjects

This study has been approved by the Brigham and Women's Hospital Institutional Review Board.

In order to complete the initial power analysis, a dummy outcome of a 90-day gap in database enrollment was used. This outcome is used to ensure that no information on the comparative risks of the outcomes of interest are available at this stage. We completed a PS overlap weighted comparative analysis using this outcome. The PS included only 3 covariates: age, sex, and combined comorbidity index. Power calculations are based on the formulas from Chow et al. (2008).
