4 INTRODUCTION

This SAP gives a detailed description of the planned statistical analysis for trial IRL757C001.

4.1 Trial design

This is a prospective, single-centre, randomised, double-blind, placebo-controlled, phase I, First-In-Human (FIH) trial evaluating the safety and tolerability of single and multiple ascending oral doses of IRL757 in healthy volunteers.

Single Ascending Dose (SAD) part: A randomised, double-blind, placebo-controlled single ascending dose trial in healthy volunteers.

Multiple Ascending Dose (MAD) part: A randomised, double-blind, placebo-controlled multiple dosing trial in healthy volunteers.

Please see the clinical trial protocol (CTP) for additional details.

4.2 Trial objectives and endpoints

Table 1 Trial objectives and endpoints

| Objectives | Endpoints | Assessments | Analyses | Data display plan (DDP) |
|--|--|--|---|--|
| Primary objective | Primary endpoints | | | |
| To evaluate the safety and tolerability of IRL757 after single and repeated dosing in healthy volunteers. | Frequency, seriousness and intensity of adverse events (AEs). | AE reporting and questioning | Descriptive statistics, Section 9.1.1 | SAD: Section 10.2.2.1 MAD: Section 11.2.2.1 |
| | Physical examination | Physical examinations | Descriptive statistics, Section 9.1.2 | SAD: Section 10.2.2.2 MAD: Section 11.2.2.2 |
| | Columbia-Suicide Severity Rating Scale (C-SSRS) | C-SSRS questionnaire | Listings, Section 9.1.3 | SAD: Listing MAD: Listing |
| | Electrocardiogram (ECG) | 12-lead safety ECG | Descriptive statistics, Section 9.1.4 | SAD: Section 10.2.2.3 MAD: Section 11.2.2.3 |
| | Telemetry recordings (SAD part of the trial only) | Telemetry | Descriptive statistics, Section 9.1.5 | SAD: Section 10.2.2.4 MAD: NA |
| | Vital signs | Blood pressure and pulse | Descriptive statistics, Section 9.1.6 | SAD: Section 10.2.2.5 MAD: Section 11.2.2.4 |
| | Safety laboratory measurements | Blood sampling for haematology, clinical chemistry and coagulation | Descriptive statistics, Section 9.1.7 | SAD: Section 10.2.2.6 MAD: Section 11.2.2.5 |
| Secondary objectives | Secondary endpoints | | | |
| <ul style="list-style-type: none"> To determine the single and multiple dose PK characteristics of IRL757 and its 3 main metabolites in healthy volunteers. To evaluate the interaction with food after single oral dosing of IRL757 on its PK characteristics and its 3 main metabolites in healthy volunteers. | <ul style="list-style-type: none"> SAD part: Area under the plasma concentration-time curve $AUC_{0-\infty}$, AUC_t, AUC_{0-24h}, maximum concentration (C_{max}), time to maximum concentration (T_{max}), terminal elimination rate constant (λ_{dz}), terminal half-life ($T_{1/2}$), total apparent clearance of drug from plasma (CL/F), volume of distribution (V_z/F), amount excreted in urine (A_e), fraction of the dose excreted in urine (F_e) (for IRL757), renal clearance CL_R. Amount excreted in urine (A_e) for the metabolites. Relative bioavailability after fed and fasting conditions determined from AUC_t and $AUC_{0-\infty}$, and C_{max}. | PK plasma and urine sampling | Descriptive statistics and dose proportionality analysis, Section 9.2.1 | SAD: Sections 10.2.3.1, 10.3.1.1 and 10.3.1.2 MAD: Sections 11.2.3.1, 11.3.1.1 and 11.3.1.2 |

| Objectives | Endpoints | Assessments | Analyses | Data display plan (DDP) |
|---|---|----------------------------------|---|-------------------------|
| | <ul style="list-style-type: none"> • MAD part, Day 1: $AUC_{0-\tau}$, C_{max}, T_{max}, λ_{dz}, $T_{1/2}$, Day 10: $AUC_{0-\tau}$, C_{max}, T_{max}, λ_{dz}, $T_{1/2}$, CL/F, V_z/F, fraction of the dose excreted in urine (F_e) (for IRL757) for the last dose interval in the morning of Day 10, renal clearance CL_R. Amount excreted in urine (A_e) for the metabolites. • Dose proportionality after single dose based on $AUC_{0-\infty}$ and C_{max}. • Dose proportionality after multiple doses based on $AUC_{0-\tau}$ and C_{max}. • Accumulation ratio (AR) after multiple doses based on C_{max} ratio and ratio $AUC_{0-\tau}$ (Day 10) to $AUC_{0-\tau}$ for the first dose interval on Day 1. | | | |
| Exploratory objectives | Exploratory endpoints | | | |
| To characterize the metabolite profile in human plasma and urine and compare metabolite exposures between human and the safety species rat and dog. | <p>Metabolite In Safety Testing (MIST) analysis of the metabolite profile in plasma in comparison with the metabolite profile in plasma from non-clinical safety studies.</p> <p>Profile of excreted metabolites in the urine.</p> | Blood sampling for MIST analysis | The analyses and results pertaining to the exploratory endpoints, MIST analysis and urine metabolite profile, will be detailed in a separate report, and hence are not covered in this SAP. | |

4.3 Randomisation and number of subjects

In both the SAD and MAD part of the trial, subjects in each cohort will be randomised to treatment with either IRL757 or placebo (3:1). Sentinel-dosing will be applied.

Forty (40) healthy subjects will be included in the SAD part of the trial.

Six (6) additional healthy subjects will be included in the food interaction sub-study.

The MAD part of the trial will include 24 or 36 healthy subjects, depending on the number of dose levels assessed, and defined following review of the data of the SAD part of the trial (two (2) or three (3) dose levels).

In the MAD part, up to twelve (12) additional subjects may also be included if recommended by the internal safety review committee.

4.4 Subject replacement

The trial subjects withdrawn for medical/safety reasons will not be replaced.

Voluntary withdrawals can be replaced if they are not evaluable. See CTP for additional details.

4.5 Blinding

This is a double-blinded trial, and the allocation of treatments will not be disclosed until clean file has been declared and the database has been locked.

5 STATISTICAL AND ANALYTICAL PLANS

5.1 Statistical hypotheses

The primary objective of this trial is to assess safety and tolerability, and no hypothesis testing will be conducted on data related to these endpoints. Additionally, as part of the secondary objectives and endpoints, this trial aims to test the hypothesis that pharmacokinetic AUC and C_{\max} are proportional to the dose administered. Please refer to sections 9.2.1.1-9.2.1.2 below for more details about the dose proportionality analyses.

5.2 Sample size calculation

No formal sample size calculation has been performed for this trial. The size of the cohorts/dose groups is considered sufficient to provide adequate information on the safety and PK parameters for the purpose of this trial.

5.3 Definition of analysis sets

The analysis sets defined for the trial are outlined in Table 2.

Table 2 Analysis sets

| Analysis set | Definition | Comment | Use of analysis set |
|-------------------------------------|---|--|---|
| Full analysis set (FAS) | All subjects who have received treatment with IMP and have available data. | | The FAS will be used for safety and tolerability assessments and description of trial population. |
| Pharmacokinetic analysis set (PKAS) | All subjects who received treatment with IMP, who provided an evaluable plasma concentration profile and who have no AEs or protocol deviations judged to affect the PK analysis. Individual PK values may be excluded from the analysis. | This set is referred to as the Per Protocol Analysis Set (PPAS) in the CTP. In the CTP, there is slightly different wording, but the definitions encompass the same subjects. Additionally, the SAP specifies that there should be no AEs that could affect the PK analysis for the included subjects. | PK endpoints. |

5.4 Definition of baseline

Baseline is defined as the latest measurement prior to (first) IMP exposure in each treatment period.

5.5 Rounding principles

Generally, no rounding of data will be done prior to calculating statistics. However, if reported data contains more than 8 significant digits it will be rounded to 8 significant digits in the database.

In statistical output and descriptive summaries, the following principles will be used:

- Data will be presented as reported in input data in listings.

- Two (2) significant digits will be used for percentages (for example relative change from baseline).
- p-values and similar statistical output will be presented using 4 decimal places.
- Three (3) significant digits will be used for PK parameters when presenting min and max values in tables.
- Descriptive summaries (e.g., mean, SD, median etc.) of PK parameters will be presented with 4 significant digits.
- Descriptive summaries (e.g., mean, SD, median etc.) of all other numerical data will be presented with one extra decimal compared to reported input data.

5.6 Significance level

All statistical hypotheses in this trial will be answered using two-sided 90% confidence intervals.

5.7 Handling of dropouts, missing data and outliers

Outliers will be included in summary tables and listings and will not be handled separately in any analyses. All collected data, even if not tabulated, will be listed. Generally, no imputation of data will be performed. However, when calculating statistics for PK plasma concentrations, concentrations under LLOQ will be replaced with LLOQ/2 if more than 50% of the values for a given time point are above LLOQ. For figures presenting individual PK concentrations, no imputation is performed for values under LLOQ. For imputation of PK plasma concentration below LLOQ with the purpose of calculating PK parameters, see Section 9.2.1.

Safety laboratory concentrations under LLOQ will be replaced with LLOQ/2 and concentrations over ULOQ will be replaced with ULOQ for the purpose of calculating descriptive statistics.

In case of missing start and stop times of AEs that cannot be investigated further, missing data will be imputed according to a worst-case scenario, i.e., start time will be imputed as the closest time point post first intake of IMP and end time as 23:59, resulting in the longest possible treatment emergent duration of the AE.

6 CHANGES FROM THE CLINICAL TRIAL PROTOCOL

Changes to the planned analyses and the timing of these are summarised in Table 3.

Table 3 Changes in the planned statistical analyses

| Change category | Timing of change | Description of change | Reason for change |
|--|------------------|--|---|
| Change in the SAP compared to the protocol | Prior to DBL | Added frequency tables for safety laboratory interpretations. | To provide a better overview of the safety laboratory data. |
| | | Added the metabolites (SAD and MAD) for the PK endpoints in Table 1. | Included in analysis. |

7 CLINICAL DATABASE PROCESSING

7.1 General information

The clinical database is processed and generated according to The Clinical Data Interchange Standards Consortium (CDISC). CDISC is a Standard Developing Organization which develops and publishes standards to normalise the structure of clinical trial data and thereby simplify submissions to and reviews by authorities such as the Food and Drug Administration (FDA).

The CDISC standards for clinical studies are the Trial Data Tabulation Model (SDTM) and the Analysis Data Model (ADaM). The trial data will be structured into a database model reflecting the SDTM and will be compliant to SDTM Implementation Guide (SDTM-IG) version 3.3. The data used for statistical analysis will be structured to reflect the ADaM and be compliant to ADaM Implementation Guide (ADaM-IG) version 1.3.

Data values are collected according to, or mapped into, controlled terminology codelists defined by CDISC, whenever possible. The codelists are updated quarterly at [REDACTED] and the latest version available at trial start will be used. As per default, controlled terminology codelists will be used in all tables, listings, and figures. Custom codelists for test or parameter names will be used if applicable upon Sponsor's request, to align with protocol texts, or to adhere to other standard naming conventions (e.g., PK parameter name "Tmax" will be used instead of the CDISC term "Time of CMAX"). These custom codelists will be mapped in the "Parameter Name" field in the ADaM structure, while the CT will be kept in the SDTM predecessor fields to provide traceability back to CDISC codelists.

7.1.1 CDISC Compliance

The trial database will be CDISC compliant which means that the clinical database will be processed and generated according to CDISC standard. The database will be validated against SDTM and ADaM Validation rules using Pinnacle 21.

The following CDISC documentation will be generated:

- SDTM Data Definition Specification (also referred to as a Define -XML)
 - Define-XML transmits metadata that describes any tabular dataset structure and supports the interchange of dataset metadata for clinical research applications in a machine-readable format.
- ADaM Data Definition Specification (also referred to as a Define -XML)
 - Define-XML transmits metadata that describes any tabular dataset structure and supports the interchange of dataset metadata for clinical research applications in a machine-readable format.
- Annotated Electronic Case Report Form (eCRF)
 - Links the data collection fields used to capture trial data to the corresponding variables in the trial database. It enables the user to understand how the trial data were collected and to trace back from trial analysis results to the origin where it was collected.
- SDTM Reviewers' Guide
 - Intended to provide additional context and act as a single point of orientation for the SDTM datasets.
- ADaM Reviewers' Guide
 - Provides regulatory agency reviewers an orientation to the submitted analysis data in a consistent way and usable format.

7.2 Database modeling of trial design

The trial design is mapped to a SDTM trial design model containing the following structural components:

EPOCH: An interval of time in the planned conduct of a trial. An epoch is associated with a purpose (e.g., screening, randomisation, treatment, follow-up), and applies across all arms of the trial. Trial epochs follow a controlled terminology to represent the different trial parts (e.g., SCREENING, TREATMENT [X], FOLLOW-UP)

ELEMENT: Building blocks used to build up the entire trial length for all subjects. Information on ELEMENTs is extracted from the trial design and schedule of events in the protocol. ELEMENTs are defined to span the entire trial without gaps. One EPOCH may contain one or several ELEMENTs. All ELEMENTs must have transition rules in accordance with the protocol to determine start and end.

ARM: Subjects are allocated to trial arms depending on the trial design, either by randomisation or other allocation processes defined in the trial protocol. ARMs are defined as the total number of planned ways a subject can go through the trial (unique combination of trial ELEMENTs). All ARMs must contain a unique sequence of ELEMENTs.

VISIT: Trial visits are defined as planned timepoints during the trial where trial data is collected. A visit can be performed in clinic, by off-site contact with trial personnel (phone call, video conference or similar), or by subject initiated recordings of data. The visit schedule is extracted from protocol and eCRF design.

A schematic representation of the SDTM trial design is presented in Figure 1 to Figure 3.

Figure 1 Schematic representation of the SDTM trial design - SAD

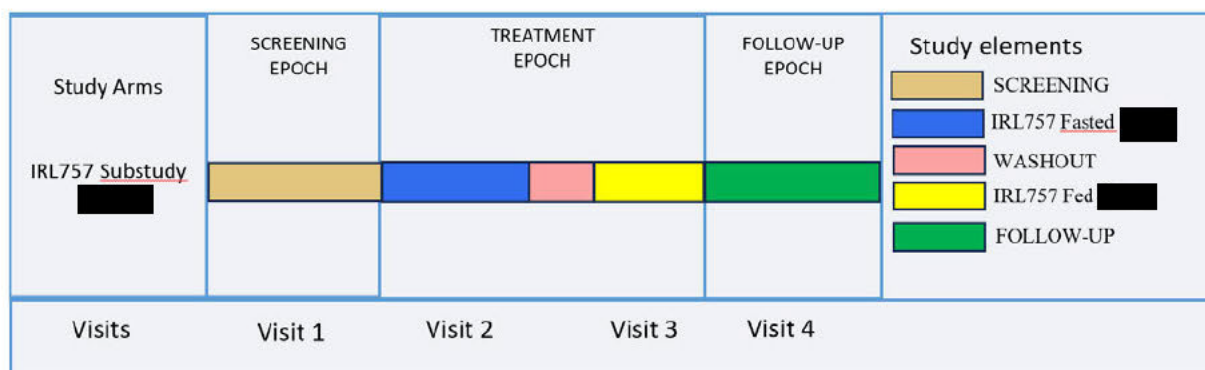

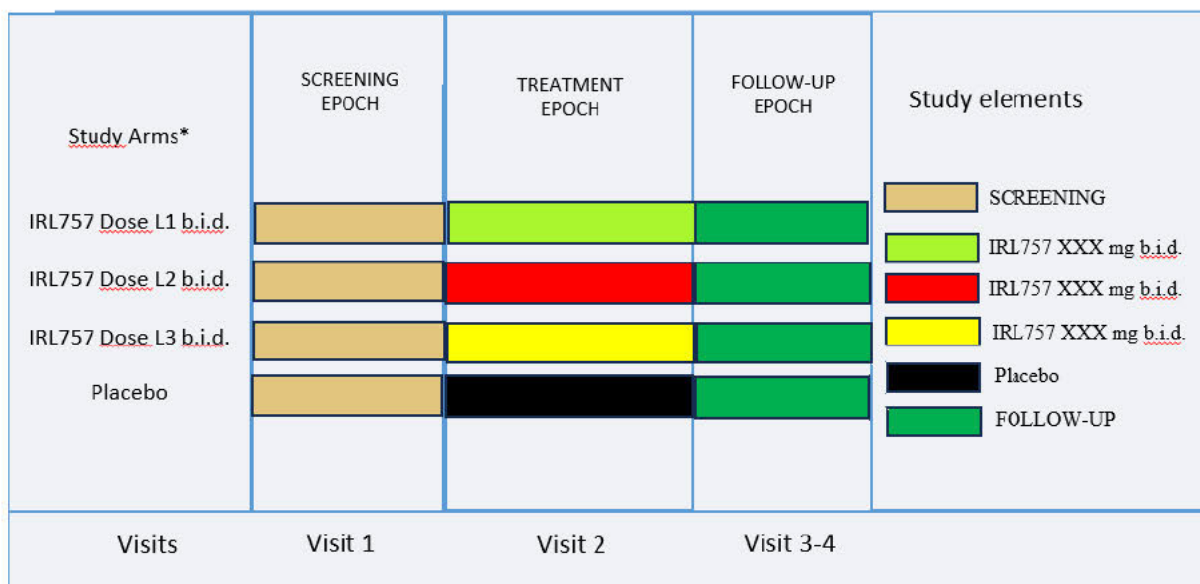

Figure 2 Schematic representation of the SDTM trial design – SAD sub-study: food interaction**Figure 3 Schematic representation of the SDTM trial design - MAD**

*L = level. Dose levels for MAD cohorts are tentative at the time of producing this figure.

b.i.d.=two times a day (bis in die)

8 STATISTICAL DELIVERABLES

The following items will be delivered:

- Statistical analyses, summary tables, listings and figures as described under Sections 10-11.
- Clinical trial database delivered as a SAS-export file (SDTM and ADaM) and Excel files (ADaM)
- Define -XML for SDTM
- Define -XML for ADaM
- Annotated eCRF
- SDTM Reviewer's Guide
- ADaM Reviewer's Guide

9 STATISTICAL METHODOLOGY

In general, data will be presented in tables with the number of observations, arithmetic mean, standard deviation (SD), median, minimum and maximum value for continuous data. In addition, 95% confidence intervals (CIs) will be added for ECG, vital signs and safety laboratory data. Categorical data will be presented with counts and percentages. All collected data will be listed by subject and treatment, except for data pertaining to the exploratory endpoints, MIST analysis and urine metabolite profile, which will be reported elsewhere. Data is generally presented by part, treatment (active/placebo, or for the SAD sub-study, fasted/fed conditions), and dose group.

SAD and MAD data will be presented separately. Additionally, the tables and figures for the food interaction sub-study will be presented separated from those of the other SAD dose groups. The data for subjects receiving placebo will be presented pooled across groups, for SAD and MAD respectively.

Details on statistical analyses and descriptive summaries are specified below.

All statistical analyses and descriptive summaries will be performed using SAS version 9.4 (SAS institute, Cary, NC).

PK parameters will be calculated by Non-Compartmental Analysis (NCA) using the software Phoenix WinNonlin[®] version 8.3(Certara, U.S.A).

9.1 Analysis of the primary endpoints

9.1.1 Adverse Events (AEs)

AEs and SAEs will be recorded from the time when informed consent is obtained until the Follow-up Visit. AEs that occur before first treatment with IMP (baseline symptoms) will be listed separately.

All AEs will be described in terms of the treatment at which they occurred. AEs will be summarised by System Organ Class (SOC) and Preferred Term (PT) using the Medical Dictionary for Regulatory Activities (MedDRA) vocabulary. The number of subjects reporting AEs, and the number of AEs reported will be presented. The events will be tabulated by SOC, PT and by severity and relationship to IMP. SAEs will be presented in the same tabulations.

9.1.2 Physical examinations

Normal and abnormal findings will be specified and summarised by part, treatment, and dose group.

9.1.3 Columbia-Suicide Severity Rating Scale (C-SSRS)

This rating scale will be administered for screening of suicidal ideation and behaviour throughout the trial. No formal statistical analysis of the outcome will be performed, i.e., the data will be listed only. Any abnormal findings will be listed and treated as AEs or SAEs.

9.1.4 Electrocardiogram (ECG)

All continuous ECG data will be listed for each subject and summarised by part, treatment and dose group. In addition, ECGs will be categorised as "normal", "abnormal, not clinically

significant”, or ”abnormal, clinically significant” (as judged by the Investigator) and summarised by part, treatment and dose group.

9.1.5 *Telemetry (SAD only)*

Telemetry interpretations will be summarised in a frequency table, by treatment and dose group.

9.1.6 *Vital signs*

Vital signs (blood pressure, heart rate, respiratory rate and body temperature) will be summarised by part, treatment and dose group.

9.1.7 *Safety laboratory analyses*

Safety laboratory data will be summarised by part, treatment and dose group. Safety laboratory interpretations will be summarised by part, treatment and dose groups using frequency tables.

9.2 *Analysis of secondary endpoints*

9.2.1 *Pharmacokinetic analysis*

The following non-compartmental plasma PK parameters will be determined/calculated during the trial conduct:

SAD

Plasma IRL757

- T_{max} – Time to reach C_{max}
- C_{max} – The maximum observed plasma concentration
- AUC_{0-last} – Area under the plasma concentration versus time curve (AUC) from timepoint 0 to t, where t represents the timepoint of the last detectable plasma concentration
- AUC_{0-24h} – (AUC) from timepoint 0 to 24 h
- AUC_{0-inf} – AUC from timepoint 0 extrapolated to infinity
- CL/F – Apparent clearance
- V_z/F – Apparent volume of distribution associated with terminal phase
- λ_{z} – Eliminate rate constant associated with the terminal phase
- $T_{1/2}$ – Terminal plasma elimination half-life

For the 3 main metabolites following PK parameters will be determined/calculated (if possible):

- T_{max}
- C_{max}
- AUC_{0-last}
- AUC_{0-24h}
- AUC_{0-inf}
- λ_{z}
- $T_{1/2}$

Parameters that are only presented in listings

- Lambda_z lower – Lower limit on time for values to be included in the calculation of Lambda_z
- Lambda_z upper – Upper limit on time for values to be included in the calculation of Lambda_z
- No points lambda_z – Number of points used in computing lambda_z
- Span – The ratio between the interval used for determination of lambda_z and the terminal $T_{1/2}$
- $\text{Rs}_q \text{ adj}$ – Goodness of fit statistic for the terminal phase, adjusted for the number of points used in the estimation of lambda_z .
- T_{last} – Time of last observed plasma concentration
- $\text{AUC}_{\text{extr}\%}$ – Percentage of $\text{AUC}_{0-\text{inf}}$ due to extrapolation from T_{last} to infinity
- $\text{AUC}_{0-48\text{h}}$ – (AUC) from timepoint 0 to 48 h

Relative bioavailability

- $F_{\text{rel}} \text{ AUC}_{0-\text{last}}$ – Relative bioavailability for $\text{AUC}_{0-\text{last}}$ after fed and fasting conditions
- $F_{\text{rel}} \text{ AUC}_{0-\text{inf}}$ – Relative bioavailability for $\text{AUC}_{0-\text{inf}}$ after fed and fasting conditions
- $F_{\text{rel}} C_{\text{max}}$ – Relative bioavailability for C_{max} after fed and fasting conditions

Fasted value will be used in the denominator.

MAD

After first dose IRL757:

- T_{max}
- C_{max}
- $\text{AUC}_{0-\text{tau}}$ – AUC from timepoint 0 to end of dosing interval (12 hour)
- Lambda_z
- $T_{1/2}$

For the 3 main metabolites following PK parameters will be determined/calculated (if possible):

- T_{max}
- C_{max}
- $\text{AUC}_{0-\text{tau}}$
- Lambda_z
- $T_{1/2}$

After last dose (at steady state (if reached)) IRL757:

- T_{max}
- C_{max}
- C_{avg} - Average concentration over dosing interval
- C_{min} - Minimum observed concentration at the end of the dosing interval
- $\text{AUC}_{0-\text{tau}}$ – AUC during dosing interval (12 hour) at steady state

- CL/F – Apparent clearance at steady state
- V_z/F – Apparent volume of distribution at steady state
- λ_z
- $T_{1/2}$

For the 3 main metabolites following PK parameters will be determined/calculated (if possible):

- T_{max}
- C_{max}
- $AUC_{0-\tau}$
- λ_z
- $T_{1/2}$

Other:

- $AR C_{max}$ – Accumulation ratio of C_{max} , ratio of last dose day over first dose day
- $AR AUC_{0-\tau}$ – Accumulation ratio of $AUC_{0-\tau}$, ratio of last dose day over first dose day

Parameters that only are presented in listings

- λ_z lower
- λ_z upper
- No points λ_z
- Span
- Rsq_{adj}
- T_{last}
- $AUC_{extr\%}$

The following non-compartmental urine PK parameters will be calculated during the trial conduct:

SAD

- A_e – Amount IRL757 excreted unchanged (IRL757 and major metabolites)
- F_e – Fraction of dose excreted in urine (only IRL757)
- CL_{renal} – Renal clearance (only IRL757)

MAD

- A_e – Amount IRL757 excreted unchanged (IRL757 and major metabolites)
- F_e – Fraction of dose excreted in urine (IRL757) for the last dose interval (only IRL757)
- CL_{renal} – Renal clearance (only IRL757)

Following units will be used:

- Time: h
- Concentration: umol/L
- AUCs: h*umol/L
- Extrapolated AUC and Fe: %
- λ_{dz} : /h
- Apparent Clearance: L/h
- Apparent Volume of distribution: L
- A_e : umol and/or mg

Non-compartmental analysis will be based on the actual sampling times recorded during the trial. For the purpose of calculating PK parameters, concentrations below lower limit of quantification (LLOQ) occurring before C_{max} will be treated as zero. Concentrations below LLOQ occurring after C_{max} will be omitted from the analysis.

T_{max} , T_{last} , and C_{max} will be based on the observed plasma concentration data.

All AUC will be assessed by integration of the plasma concentration vs time curve using linear interpolation for increasing plasma levels and logarithmic interpolation for decreasing plasma levels (Linear Up-Log Down method).

AUC_{0-last} will be calculated from time 0 to the time t of the last detectable plasma concentration.

For AUC_{0-inf} the area will be calculated to the last timepoint showing a measurable plasma concentration and then extrapolated to infinity using the concentration in the last quantifiable sample and λ_{dz} .

$$AUC_{0-inf} = AUC_{0-last} + \frac{C_{last}}{\lambda_{dz}}$$

Partial AUC/ AUC_{tau} will be derived according to specified time windows/dosing interval, if the end time of the interval does not occur at an actual timepoint either linear interpolation or extrapolation will be used for derivation of the partial AUC. Extrapolation, using λ_{dz} , will only be used if the end time of specified interval occur after last detectable plasma concentration.

Formulas for calculation of AUC

- Linear trapezoidal rule:

$$AUC|_{t_1}^{t_2} = \delta t \times \frac{C_1 + C_2}{2}$$

- Logarithmic trapezoidal rule:

$$AUC|_{t_1}^{t_2} = \delta t \times \frac{C_2 - C_1}{\ln\left(\frac{C_2}{C_1}\right)}$$

where t = time, c = concentration, $\delta t = t_2 - t_1$.

Formulas for interpolation (to find C^* at time t^* for $t_1 < t^* < t_2$)

- Linear interpolation rule:

$$C^* = C_1 + \left| \frac{t^* - t_1}{t_2 - t_1} \right| (C_2 - C_1)$$

- Logarithmic interpolation rule:

$$C^* = \exp \left(\ln(C_1) + \left| \frac{t^* - t_1}{t_2 - t_1} \right| * (\ln(C_2) - \ln(C_1)) \right)$$

where t = time, c = concentration

λ_{z} , the first order rate constant associated with the terminal portion of the curve will be determined by lin-logarithmic regression of the terminal elimination phase of individual plasma concentration vs time curves. Determination of λ_{z} requires identification of a sufficiently linear terminal phase (as determined by visual inspection of the lin-log plasma concentration vs time plot with the regression line) consisting of at least 3 terminal concentration values (not including C_{\max}). If this is not achieved, λ_{z} and its dependent PK parameters will not be reported for that profile.

In the following cases, λ_{z} dependent PK parameters will be flagged in listings as potentially unreliable:

- λ_{z} estimation is based on a period of less than 1.5 times the resulting $T_{1/2}$.
- The Rsq adjusted value of the regression line is < 0.85 .
- The estimated % extrapolated AUC is $> 20\%$ $((AUC_{0-\text{inf}} - AUC_{0-\text{last}} / AUC_{0-\text{inf}}) * 100)$.

$T_{1/2}$ will be calculated accordingly:

$$T_{1/2} = \frac{\ln(2)}{\lambda_{z}}$$

Span will be calculated accordingly:

$$\text{Span} = \frac{\lambda_{z \text{ upper}} - \lambda_{z \text{ lower}}}{T_{1/2}}$$

CL will be calculated accordingly:

$$\text{Single dose: } \frac{CL}{F} = \frac{Dose}{AUC_{0-inf}} \quad \text{Steady state: } \frac{CL}{F} = \frac{Dose}{AUC_{0-tau}}$$

V_z will be calculated accordingly:

$$\text{Single dose: } \frac{V_z}{F} = \frac{Dose}{\lambda_{dz} * AUC_{0-inf}} \quad \text{Steady state: } \frac{V_z}{F} = \frac{Dose}{\lambda_{dz} * AUC_{0-tau}}$$

A_e will be calculated accordingly:

$$A_e = \sum_{i=1}^n v_i * c_i$$

Let v be the volume of urine and c the concentration of drug in urine, the product of v and c for one interval (i) represent A_e . The A_e over 0-12 hours (MAD BID), 0-24 hours (SAD 1-4) and 0-48 hours (SAD 5) is the sum of all intervals. The weight of the collected urine fractions will be calculated assuming a urine density of 1.00 g/mL.

CL_{renal} will be calculated accordingly:

$$\text{Single dose: } CL_{renal} = \frac{A_e}{AUC_{0-end of dosing interval}}$$

$$\text{Steady state: } CL_{renal} = \frac{A_e}{AUC_{0-tau}}$$

If there is a confirmed dosing error during the trial, the pharmacokinetic data for that period will only be included in the listings but excluded from descriptive and statistical analyses. In case of missed blood samples, potential impact on PK parameters will be assessed for each individual case. PK parameters with a high degree of uncertainty due to missing samples (e.g., multiple samples missing around C_{max}) will be flagged as unreliable in the report and may in rare cases be excluded from summary tables, descriptive statistics, and statistical analysis.

Descriptive statistics for the PK parameters will be presented by part and dose group using summary statistics with the number of measurements (n), arithmetic mean, SD, as well as median, minimum and maximum values. For all applicable PK parameters, the geometric mean and geometric coefficient of variation (CV%) will be presented. For the parameter T_{max} , the number of observations, and median, minimum and maximum values will be presented only. For the relative bioavailability ratios, 90% confidence intervals (CIs) are presented.

9.2.1.1 Dose proportionality analysis - SAD

Dose-proportionality (an increase in dose corresponds to a proportional increase in PK outcome) after a single dose, will be assessed using the power model, i.e., linear regression modelling of $AUC_{0-\infty}$ and C_{\max} respectively on log-scale according to the formula:

$$\ln(PK) = \beta_0 + \beta_1 \times \ln(dose)$$

Let h be the highest dose and l be the lowest dose. Then the predicted PK geometric mean (back-transformed to normal scale) of the high dose is $e^{\beta_0} h^{\beta_1}$, and that of the low dose is $e^{\beta_0} l^{\beta_1}$. Let r be the maximal dose ratio, i.e., h/l . Dose proportionality corresponds to:

$$e^{\beta_0} h^{\beta_1} / e^{\beta_0} l^{\beta_1} = h/l \rightarrow (h/l)^{\beta_1-1} = r^{\beta_1-1} = 1$$

Let $\Theta_L=0.8$ and $\Theta_H=1.25$ be the lower and upper acceptance limits respectively, (0.8 and 1.25 being the industry standard limits). Dose-proportionality occurs when

$$\Theta_L < r^{\beta_1-1} < \Theta_H,$$

which on natural log scale equates to

$$\ln(\Theta_L) < (\beta_1 - 1)\ln(r) < \ln(\Theta_H) \rightarrow 1 + \frac{\ln(\Theta_L)}{\ln(r)} < \beta_1 < 1 + \frac{\ln(\Theta_H)}{\ln(r)}$$

Specifically, dose-proportionality is declared when the 90% CI for β_1 from the linear regression model on log scale lies entirely within the acceptance region:

$$\left[1 + \frac{\ln(0.8)}{\ln(r)}, 1 + \frac{\ln(1.25)}{\ln(r)} \right]$$

Dose proportionality analysis will include all the SAD fasted cohorts (including data from the fasting part of the sub-study).

9.2.1.2 Dose proportionality analysis - MAD

Dose proportionality after last dose for the MAD part of the study will be based on $AUC_{0-\tau}$ and C_{\max} . The dose proportionality analyses will be performed if data from three or more dose levels are available.

9.3 Analysis of exploratory endpoints

The analyses and results pertaining to the exploratory endpoints, MIST analysis and urine metabolite profile, will be detailed in a separate report, and hence are not covered in this SAP.

9.4 Description of trial population

9.4.1 Disposition

A subject disposition will be presented by part showing the number of screened subjects; the number of withdrawn subjects prior to dose, including the reason for withdrawal; the number of included subjects in each cohort; the number of withdrawn subjects, including the reason for withdrawal; the number of completed subjects; the number of subjects included in the analysis sets, and the number of subjects at each visit.

9.4.2 Demographics and baseline characteristics

Descriptive statistics of demographics and other baseline characteristics will be presented by part, treatment and dose group.

9.4.3 *Medical history and concomitant medication*

Medical/surgical history and prior/concomitant medications will be presented by descriptive statistics by part, treatment and dose group.

Medications are classified as prior if the stop date and time was before or on the day of the dose administration (pre-dose) and as concomitant if ongoing on the day of the dose administration, stopped after the dose administration or started after the dose administration. To distinguish between prior and concomitant medications on the dosing day, the start time of any newly introduced medication or the stop time of any previously ongoing medication will be considered.

Medical/surgical history will be summarised by SOC and PT using the MedDRA vocabulary.

Prior and concomitant medications will be summarised by ATC classification and active ingredients using the World Health Organisation (WHO) WHODrug Global drug reference dictionary.

9.4.4 *Treatment compliance*

The subjects treated in each part and treatment dose group and their individual doses will be listed.

9.5 *Interim analysis*

No formal interim analysis will be performed.

10 DATA DISPLAY PLAN - SAD

Tables and figures will only be generated if sufficient data, with sufficient variability exist to justify specific output being produced. Unscheduled/extra visits will generally not be presented in tables and summary figures but will be included in listings.

11.3 Trial figures - MAD

11.3.1 Secondary endpoints

11.3.1.1 Pharmacokinetic analysis

Figure PC 1 Geometric mean plasma concentrations of IRL757 over time (lin-log) - MAD (Pharmacokinetic analysis set)

Including all timepoints (after first and last dose)

Example figure. Note that the numbers do not reflect real data. This template figure will be adjusted as needed depending on the collected data.

Data based on [population]. LLOQ is xx (unit). See listing 16.2.5-1 for a per subject LLOQ summary. lin: Linear. SAS program: [PROGRAM NAME].sas.
Dataset version: ADXX YYYY-MM-DDTHH:MM:SS. Run by: [USERNAME] YYYY-MM-DDTHH:MM:SS. EDC data extracted: YYYY-MM-DDTHH:MM:SS.

Figure PC 2 Geometric mean plasma concentrations of IRL757 over time (lin-lin) - MAD (Pharmacokinetic analysis set)

Including all timepoints (after first and last dose). Same layout as Figure PC 1

Figure PC 3 Geometric mean plasma concentrations of IRL757 over time 0-12h, after first dose (lin-log) - MAD (Pharmacokinetic analysis set)

Same layout as Figure PC 1

Figure PC 4 Geometric mean plasma concentrations of IRL757 over time 0-12h, after first dose (lin-lin) - MAD (Pharmacokinetic analysis set)

Same layout as Figure PC 1

Figure PC 5 Geometric mean plasma concentrations of IRL757 over time 0-48h, after last dose (lin-log) - MAD (Pharmacokinetic analysis set)

Same layout as Figure PC 1

Figure PC 6 Geometric mean plasma concentrations of IRL757 over time 0-48h, after last dose (lin-lin) - MAD (Pharmacokinetic analysis set)

Same layout as Figure PC 1

Figure PC 7 Geometric mean plasma concentrations of 3 main metabolites over time (lin-log) - MAD (Pharmacokinetic analysis set)

Including all timepoints (after first and last dose)

Same layout as Figure PC 1

Figure PC 8 Geometric mean plasma concentrations of 3 main metabolites over time (lin-lin) - MAD (Pharmacokinetic analysis set)

Including all timepoints (after first and last dose)

Same layout as Figure PC 1

Figure PC 9 Geometric mean plasma concentrations of 3 main metabolites over time 0-12h, after first dose (lin-log) - MAD (Pharmacokinetic analysis set)

Same layout as Figure PC 1

Figure PC 10 Geometric mean plasma concentrations of 3 main metabolites over time 0-12h, after first dose (lin-lin) - MAD (Pharmacokinetic analysis set)

Same layout as Figure PC 1

Figure PC 11 Geometric mean plasma concentrations of 3 main metabolites over time 0-48h, after last dose (lin-log) - MAD (Pharmacokinetic analysis set)

Same layout as Figure PC 1

Figure PC 12 Geometric mean plasma concentrations of 3 main metabolites over time 0-48h, after last dose (lin-lin) - MAD (Pharmacokinetic analysis set)

Same layout as Figure PC 1

Figure PC 13 Individual plasma concentrations of IRL757 over time 0-12h, by treatment, after first dose (lin-log) - MAD (Full analysis set)

Individual values under LLOQ will be excluded from the figure. The full analysis set is used for individual graphs to ensure all data are plotted. However, ensure to clarify in a footnote if a subject is not in PKAS and why.

Example figure. Note that the numbers do not reflect real data. This template figure will be adjusted as needed depending on the collected data.

Data based on [population]. Individual values under LLOQ are excluded from the figure. LLOQ is xx (unit). See listing 16.2.5-1 for a per subject LLOQ summary. SAS program: [PROGRAM NAME].sas. Dataset version: ADXX YYYY-MM-DDTHH:MM:SS. Run by: [USERNAME] YYYY-MM-DDTHH:MM:SS. EDC data extracted: YYYY-MM-DDTHH:MM:SS.

Figure PC 14 Individual plasma concentrations of IRL757 over time 0-12h, by treatment, after first dose (lin-lin) - MAD (Full analysis set)

Individual values under LLOQ will be excluded from the figure. The full analysis set is used for individual graphs to ensure all data are plotted. However, ensure to clarify in a footnote if a subject is not in PKAS and why.

Example figure. Note that the numbers do not reflect real data. This template figure will be adjusted as needed depending on the collected data.

- **Listing 16.2.4- 2 Medical History - MAD (All subjects)**
- **Listing 16.2.4- 3 Prior and concomitant medications - MAD (All subjects)**
- **Listing 16.2.4- 4 Baseline events - MAD (All subjects)**

16.2.5 Compliance and/or Drug Concentration Data

- **Listing 16.2.5- 1 Plasma concentration data - MAD (All subjects)**
- **Listing 16.2.5- 2 Urine concentration data - MAD (All subjects)**
- **Listing 16.2.5- 3 Pharmacokinetic parameters - MAD (All subjects)**
- **Listing 16.2.5- 4 IMP administration - MAD (All subjects)**

16.2.6 Individual Efficacy Response Data

NA

16.2.7 Adverse event listings (each subject)

- **Listing 16.2.7- 1 Adverse events - MAD (All subjects)**
- **Listing 16.2.7- 2 Serious adverse events - MAD (All subjects)**

16.2.8 Listings of individual laboratory measurements subject

- **Listing 16.2.8- 1 Safety laboratory measurements: Clinical chemistry - MAD (All subjects)**
- **Listing 16.2.8- 2 Safety laboratory measurements: Haematology - MAD (All subjects)**
- **Listing 16.2.8- 3 Safety laboratory measurements: Coagulation - MAD (All subjects)**
- **Listing 16.2.8- 4 Other laboratory measurements - MAD (All subjects)**

Pregnancy test, Drug test, Alcohol screen

- **Listing 16.2.8- 5 Virology - MAD (All subjects)**

16.2.9 Listings of vital signs, ECG, physical examination data by subject

- **Listing 16.2.9- 1 Vital signs - MAD (All subjects)**
- **Listing 16.2.9- 2 ECG - MAD (All subjects)**
- **Listing 16.2.9- 3 Physical examinations - MAD (All subjects)**

16.2.10 Other data by participant

- **Listing 16.2.10- 1 Columbia-Suicide Severity Rating Scale (C-SSRS) - MAD (All subjects)**
