2. Abstract

This is a non-randomized, non-interventional study that is part of the *Randomized Controlled Trials Duplicated Using Prospective Longitudinal Insurance Claims: Applying Techniques of Epidemiology* (RCT-DUPLICATE) initiative (www.rctduplicate.org) of the Brigham and Women's Hospital, Harvard Medical School. It is intended to emulate, as closely as is possible in healthcare insurance claims data, the SUMMIT trial described below. Although many features of the trial cannot be directly replicated in healthcare claims, key design features, including outcomes, exposures, and inclusion/exclusion criteria, were selected to proxy those features from the trial. In addition to closely emulating the trial population, this study also evaluates outcomes in a broader, less restrictive cohort to enhance generalizability to patients typically encountered in routine clinical practice. Randomization cannot be achieved in healthcare claims data but was proxied through a statistical balancing of measured covariates according to standard practice. Investigators assume that the RCT provides guidance on the reference standard treatment effect estimate. However, failure to replicate RCT findings is not necessarily indicative of the inadequacy of the healthcare claims data for emulation for a range of possible reasons, as the end points examined in the database study were partly only of exploratory nature in the trial. Moreover, divergence from these end points do not provide information on the validity of the original RCT finding.

The SUMMIT trial is a superiority trial that included an evaluation of the effect of tirzepatide, a dual glucose-dependent insulinotropic polypeptide (GIP) and glucagon-like peptide-1 (GLP-1) receptor agonist (RA), vs placebo on all-cause mortality or worsening heart failure events among individuals with heart failure with preserved ejection fraction.

The database study designed to emulate the type 2 diabetes mellitus (T2DM) subgroup of the SUMMIT trial will be a new-user active-comparative study, conducted using 2 national United States claims databases, where we compare the effect of tirzepatide vs sitagliptin, a dipeptidyl peptidase-4 inhibitor (DPP4i) on the composite end point of all-cause mortality or heart failure hospitalization. While the SUMMIT trial was conducted in participants with and without T2DM, both subgroups showed similar effect estimates in their results. Furthermore, while the trial compared tirzepatide vs placebo, we chose to use sitagliptin as an active-comparator proxy for placebo in the T2DM subgroup. Sitagliptin was specifically chosen because a major randomized controlled trial on cardiovascular outcomes demonstrated that the drug does not affect the cardiovascular outcomes under investigation. Furthermore, clinical guidelines during the study period recommended both drug classes under investigation as second- or third-line options for glucose lowering and were similarly costly.

The study will use two data sources: Optum Clinformatics and Merative Marketscan.
Optum: Study period between May 13, 2022 to November 30, 2024.
Marketscan: Study period between May 13, 2022 to December 31, 2023.

3. Amendments and updates

Version date	Version number	Section of protocol	Amendment or update	Reason
May 2, 2025	2	6.2 Study diagram (Figure 1), 10 Appendices	Added pregnancy as exclusion criterion	The exclusion for pregnancy was in the RCT protocol. It was not used as an exclusion in the initial version of this protocol due to an oversight.

4. Rationale and background

The purpose of this protocol is to specify the emulation of the SUMMIT trial (NCT04847557). Tirzepatide became available on May 13, 2022, when it was approved to treat type 2 diabetes mellitus.[1] A year later, on November 8, 2023 tirzepatide was approved for chronic weight management in adults with obesity or overweight who also have at least one weight-related comorbid condition, such as hypertension, dyslipidemia, type 2 diabetes mellitus, obstructive sleep apnea, or cardiovascular disease. On December 20 2024, tirzepatide was approved to treat moderate to severe obstructive sleep apnea (OSA) in adults with obesity, to be used in combination with a reduced-calorie diet and increased physical activity.

The SUMMIT trial enrolled 731 participants between February 2, 2017 – April 26, 2021. The trial had a follow-up period of 104 weeks with 36 (9,9%) composite events occurring in the treatment group compared to 53 (14.4%) composite events of all-cause mortality or worsening heart failure events (exacerbated symptoms of heart failure resulting in hospitalization, intravenous diuretic therapy in an urgent care setting) occurring in the placebo group. The trial was not powered for this exploratory end point. It was conducted with 80% power for its first primary end points of the composite of adjudicated death from cardiovascular causes or a worsening heart-failure event and with 80% power for the change from baseline to 52 weeks in the Kansas City Cardiomyopathy Questionnaire clinical summary score with a 0.05 type I error rate to confirm superiority.

Sitagliptin was specifically chosen as an active comparator that could proxy for placebo because a major randomized controlled trial on cardiovascular outcomes demonstrated that it does not affect the cardiovascular outcomes under investigation.[2] This contrasts with other DPP4i such as saxagliptin, which has raised concerns regarding potential increased risks of heart failure, [3–6] and linagliptin, which is commonly prescribed for patients with renal impairment because it does not require dose modifications based on kidney function, potentially leading to increased confounding compared to sitagliptin.[7,8] Sodium-glucose cotransporter-2 (SGLT2) inhibitors would not be a neutral comparator, as they significantly reduce clinically important

kidney events, kidney failure, and cardiovascular events.[9–12] Sulfonylureas (SUs), though inexpensive and widely used, are a poor comparator in cardiovascular outcome studies due to their association with hypoglycemia, weight gain, and channeling bias, as they are often prescribed to elderly, lower socioeconomic status patients with higher baseline cardiovascular risk, making direct comparisons to GLP-1-RAs less reliable.[13]

5. Research question and objectives

Table 2. Primary and secondary research questions and objectives

A. Co-Primary research questions and objectives

Objective:	To evaluate the comparative effect of tirzepatide vs sitagliptin on all-cause mortality or heart failure hospitalization in patients with heart failure with preserved ejection fraction when following the eligibility criteria of the SUMMIT trial.
Hypothesis:	We hypothesize that tirzepatide will be superior to sitagliptin in individuals with heart failure with preserved ejection fraction at preventing all-cause mortality or heart failure hospitalization.
Population (mention key inclusion-exclusion criteria):	Individuals aged 40 years or older with heart failure with preserved ejection fraction.
Exposure:	Tirzepatide.
Comparator:	Sitagliptin.
Outcome:	Composite of all-cause mortality or heart failure hospitalisation.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, start of any other GLP-1-RA.
Setting:	The outcome will be measured from inpatient hospitalizations and death.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of tirzepatide vs sitagliptin on all-cause mortality or heart failure hospitalization in patients with heart failure with preserved ejection fraction when relaxing the eligibility criteria of the SUMMIT trial.

Hypothesis:	We hypothesize that tirzepatide will be superior to sitagliptin in individuals with heart failure with preserved ejection fraction at preventing all-cause mortality or heart failure hospitalization.
Population (mention key inclusion-exclusion criteria):	Individuals aged 40 years or older with heart failure with preserved ejection fraction when relaxing the eligibility criteria of the SUMMIT trial (e.g., including patients with previous cardiovascular events, dyspnoea-related diagnoses, etc., to reflect a broader patient population from routine care).
Exposure:	Tirzepatide.
Comparator:	Sitagliptin.
Outcome:	Composite of all-cause mortality or heart failure hospitalization.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, start of any other GLP-1-RA.
Setting:	The outcome will be measured from inpatient hospitalizations, intravenous diuretic therapy in an outpatient setting, and death.
Main measure of effect:	Hazard ratio.

B. Secondary research questions and objectives

Objective:	To evaluate the comparative effect of tirzepatide vs sitagliptin on all-cause mortality or worsening heart failure events with heart failure with preserved ejection fraction in two populations: (1) patients meeting the eligibility criteria of the SUMMIT trial, and (2) a broader patient population when relaxing the eligibility criteria of the SUMMIT trial.
Hypothesis:	We hypothesize that tirzepatide will be superior to sitagliptin in individuals with heart failure with preserved ejection fraction at preventing all-cause mortality or worsening heart failure events.
Population (mention key inclusion-exclusion criteria):	Two populations: (1) individuals aged 40 years or older with heart failure with preserved ejection fraction meeting the strict eligibility criteria of the SUMMIT trial; and (2) individuals aged 40 years or older with heart failure with preserved ejection fraction identified using relaxed eligibility criteria of the SUMMIT trial (e.g., including patients with prior cardiovascular events, dyspnea-related diagnoses, or other comorbidities) to represent a broader patient population encountered in routine clinical practice.
Exposure:	Tirzepatide.
Comparator:	Sitagliptin.

Outcome:	Composite of all-cause mortality or a worsening heart failure event (exacerbated symptoms of heart failure resulting in hospitalization, intravenous diuretic therapy in an urgent care setting), and its respective individual end points.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, start of any other GLP-1-RA.
Setting:	The outcome will be measured from inpatient hospitalizations, intravenous diuretic therapy in an outpatient setting, and death.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of tirzepatide vs sitagliptin on the safety outcome of urinary tract infections in two populations: (1) patients meeting the eligibility criteria of the SUMMIT trial, and (2) a broader patient population when relaxing the eligibility criteria of the SUMMIT trial.
Hypothesis:	We hypothesize that tirzepatide will not have a different effect from sitagliptin.
Population (mention key inclusion-exclusion criteria):	Two populations: (1) individuals aged 18 years or older with heart failure with preserved ejection fraction meeting the strict eligibility criteria of the SUMMIT trial; and (2) individuals aged 18 years or older with heart failure with preserved ejection fraction identified using relaxed eligibility criteria of the SUMMIT trial (e.g., including patients with prior cardiovascular events, dyspnea-related diagnoses, or other comorbidities) to represent a broader patient population encountered in routine clinical practice.
Exposure:	Tirzepatide.
Comparator:	Sitagliptin.
Outcome:	Urinary tract infections.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, start of any other GLP-1-RA.
Setting:	The outcome will be measured using diagnosis codes in an inpatient or outpatient setting that are followed by a antibiotic prescription within 7 days of the diagnosis code.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of tirzepatide vs sitagliptin on the safety outcome of serious bacterial infections in two populations: (1) patients meeting the eligibility criteria of the

	SUMMIT DM trial, and (2) a broader patient population when relaxing the eligibility criteria of the SUMMIT DM trial.
Hypothesis:	We hypothesize that tirzepatide will not have a different effect from sitagliptin.
Population (mention key inclusion-exclusion criteria):	Two populations: (1) individuals aged 18 years or older with heart failure with preserved ejection fraction meeting the strict eligibility criteria of the SUMMIT DM trial; and (2) individuals aged 18 years or older with heart failure with preserved ejection fraction identified using relaxed eligibility criteria of the SUMMIT DM trial (e.g., including patients with prior cardiovascular events, dyspnea-related diagnoses, or other comorbidities) to represent a broader patient population encountered in routine clinical practice.
Exposure:	Tirzepatide.
Comparator:	Sitagliptin.
Outcome:	Serious bacterial infections.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, start of any other GLP-1-RA.
Setting:	The outcome will be measured using primary diagnosis codes in an inpatient setting.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the comparative effect of tirzepatide vs sitagliptin on the safety outcome of gastrointestinal adverse events in two populations: (1) patients meeting the eligibility criteria of the SUMMIT trial, and (2) a broader patient population when relaxing the eligibility criteria of the SUMMIT trial.
Hypothesis:	We hypothesize that tirzepatide will have more events compared to sitagliptin.
Population (mention key inclusion-exclusion criteria):	Two populations: (1) individuals aged 18 years or older with heart failure with preserved ejection fraction meeting the strict eligibility criteria of the SUMMIT trial; and (2) individuals aged 18 years or older with heart failure with preserved ejection fraction identified using relaxed eligibility criteria of the SUMMIT trial (e.g., including patients with prior cardiovascular events, dyspnea-related diagnoses, or other comorbidities) to represent a broader patient population encountered in routine clinical practice.
Exposure:	Tirzepatide.
Comparator:	Sitagliptin.
Outcome:	Gastrointestinal adverse events.
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, start of any other GLP-1-RA.

Setting:	The outcome will be measured using diagnosis codes in an inpatient and outpatient setting.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the effect of tirzepatide vs sitagliptin on a negative control outcome of hernia in two populations: (1) patients meeting the eligibility criteria of the SUMMIT trial, and (2) a broader patient population when relaxing the eligibility criteria of the SUMMIT trial.
Hypothesis:	We hypothesize that tirzepatide will not have a different effect from sitagliptin.
Population (mention key inclusion-exclusion criteria):	Two populations: (1) individuals aged 40 years or older with heart failure with preserved ejection fraction meeting the strict eligibility criteria of the SUMMIT trial; and (2) individuals aged 40 years or older with heart failure with preserved ejection fraction identified using relaxed eligibility criteria of theSUMMIT trial (e.g., including patients with prior cardiovascular events, dyspnea-related diagnoses, or other comorbidities) to represent a broader patient population encountered in routine clinical practice.
Exposure:	Tirzepatide.
Comparator:	Sitagliptin.
Outcome:	Hernia (excluding patients with recent outcome prior to the follow-up time window (30 days)).
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, start of any other GLP-1-RA.
Setting:	The outcome will be measured using diagnosis codes in an inpatient or outpatient setting.
Main measure of effect:	Hazard ratio.

Objective:	To evaluate the effect of tirzepatide vs sitagliptin on a negative control outcome of lumbar radiculopathy in two populations: (1) patients meeting the eligibility criteria of the SUMMIT trial, and (2) a broader patient population when relaxing the eligibility criteria of the SUMMIT trial.
Hypothesis:	We hypothesize that tirzepatide will not have a different effect from sitagliptin.
Population (mention key inclusion-exclusion criteria):	Two populations: (1) individuals aged 40 years or older with heart failure with preserved ejection fraction meeting the strict eligibility criteria of the SUMMIT trial; and (2) individuals aged 40 years or older with heart failure with preserved ejection fraction identified using relaxed eligibility criteria of theSUMMIT trial (e.g., including patients with prior cardiovascular events, dyspnea-related diagnoses, or other comorbidities) to represent a broader patient population encountered in routine clinical practice.

Exposure:	Tirzepatide.
Comparator:	Sitagliptin.
Outcome:	Lumbar radiculopathy (excluding patients with recent outcome prior to the follow-up time window (30 days)).
Time (when follow-up begins and ends):	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, start of any other GLP-1-RA.
Setting:	The outcome will be measured using diagnosis codes in an inpatient or outpatient setting.
Main measure of effect:	Hazard ratio.

6. Research methods

6.1 Study design

Research design (e.g. cohort, case-control, etc.): New user active-comparator cohort study.

Rationale for study design choice: The new user active-comparator design is a powerful design that may be able to address confounding by indication. It accomplishes this, in large part, through judicious selection of an appropriate active-comparator group.[14,15] While selection of an appropriate comparator in the design phase is crucial, cohort studies often require additional adjustment of measurable confounders. A common method for adjusting for confounding is via a propensity score.

6.2 Study design diagrams when following the eligibility criteria of the SUMMIT trial (Figure 1) and when relaxing the eligibility criteria of the SUMMIT trial (Figure 2).

Figure 1. Exposure-based cohort entry where the cohort entry date is selected after application of exclusion criteria

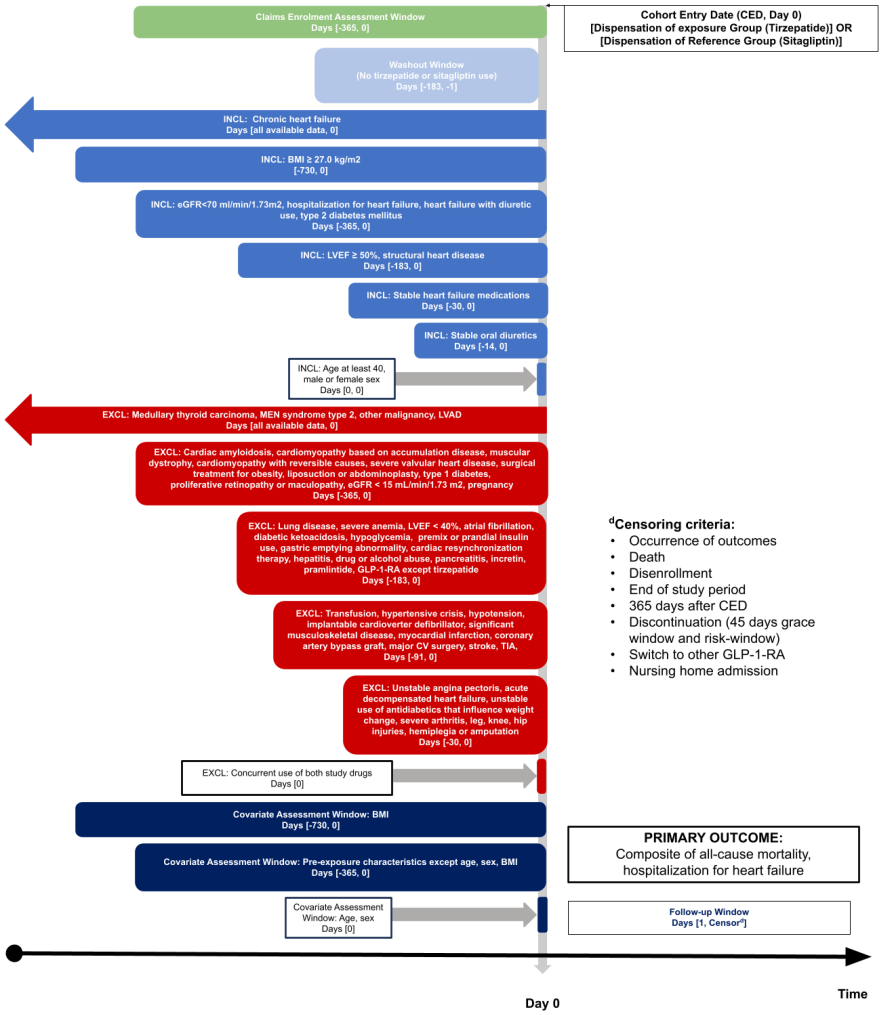

Figure 2. Exposure-based cohort entry where the cohort entry date is selected after application of exclusion criteria

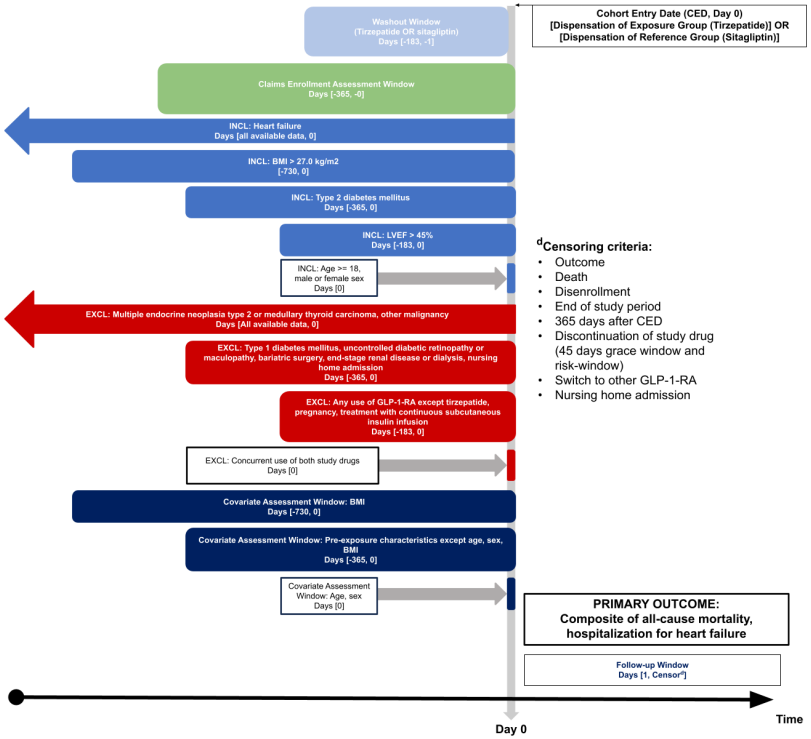

6.3 Setting

6.3.1 Context and rationale for definition of time 0 (and other primary time anchors) for entry to the study population

Time 0 in the database study was defined to emulate randomization to tirzepatide vs sitagliptin in the trial design. See appendix tables 1[strict, relaxed] and 2a[strict, relaxed] for operational definitions and detailed code algorithms.

6.3.2 Context and rationale for study inclusion criteria:

Study inclusion criteria were defined to either emulate the inclusion criteria for the trial (strict), or broadened to reflect clinical routine care settings (relaxed). See appendix tables 1[strict, relaxed] and 2[strict, relaxed] for operational definitions and detailed code algorithms. A flowchart of the study cohort assembly is provided in appendices 3[strict, relaxed].

6.3.3 Context and rationale for study exclusion criteria

Study exclusion criteria were defined to either emulate the exclusion criteria for the trial (strict), or broadened to reflect clinical routine care settings (relaxed). See appendix tables 1[strict, relaxed] and 2[strict, relaxed] for operational definitions and detailed code algorithms. A flowchart of the study cohort assembly is provided in appendices 3[strict, relaxed].

6.4 Variables

6.4.1 Context and rationale for exposure(s) of interest

The exposure and comparator were defined to emulate the agents compared for the trial, tirzepatide vs sitagliptin (active-comparator placebo proxy). See appendix tables 1[strict, relaxed] and 2[strict, relaxed] for operational definitions and detailed code algorithms.

Algorithm to define duration of exposure effect:

Assuming the effect of the drug lasts for 45 days after the last day's supply, we allow a 45 days gap between the dispensation (grace period) and also add 45 days at the end of the last day's supply (exposure risk window).

6.4.2 Context and rationale for outcome(s) of interest

The secondary outcome for the database study was defined to benchmark to the composite end point of all-cause mortality or worsening heart failure events in the SUMMIT trial. See appendix tables 1[strict, relaxed] and 2d[strict, relaxed] for operational definitions and detailed code algorithms. Optum includes death information from the inpatient discharged dead status, social security death master file, and deaths scraped from obituaries or other sources. MarketScan includes information from the inpatient discharged dead status up until 2016. PPV for heart failure diagnosis using ICD9 codes was 87% and for HHF 98%.[16,17]

Secondary outcomes from the trial that will be evaluated include:

1. Composite of all-cause mortality or a worsening heart failure event (exacerbated symptoms of heart failure resulting in hospitalization or intravenous diuretic therapy in an urgent care setting).
2. Worsening heart failure event (exacerbated symptoms of heart failure resulting in hospitalization or intravenous diuretic therapy in an urgent care setting).
3. Intravenous diuretic therapy in an urgent care setting.
4. Hospitalization for heart failure.
5. All-cause mortality.

Safety outcomes of interest include:

1. Urinary tract infections.
2. Serious bacterial infections.
3. Gastrointestinal adverse events.

Control outcomes of interest include:

1. Hernia (excluding patients with recent outcome prior to the follow-up time window). This is a negative control outcome where no difference in effect is expected for semaglutide vs sitagliptin.
2. Lumbar radiculopathy (excluding patients with recent outcome prior to the follow-up time window). This is a negative control outcome where no difference in effect is expected for semaglutide vs sitagliptin.

6.4.3 Context and rationale for follow-up

Both on-treatment (OT) and intention-to-treat (ITT) analyses will be conducted. Adherence in clinical practice databases is expected to be much worse than in the trial, therefore the OT analysis will be the primary analysis. The OT analysis targets the relative hazard of outcomes while on treatment and may more closely emulate the effect observed in highly adherent trial participants. Both OT and ITT will be conducted at 1-year follow-up and compared to the hazard ratio of cumulative incidence rates observed in the trial.

Table 1. Operational Definitions of follow-up

follow-up start	Day 1	
follow-up end[1]	**Select all that apply**	**Specify**
Date of outcome	Yes	
Date of death	Yes	Part of the primary outcome.
End of observation in data	Yes	Date of disenrollment.
Day X following index date (specify day)	Yes	Day 365.
End of study period (specify date)	Yes	Different dates for different databases (Optum: November 30, 2024; Marketscan: December 31, 2023).
End of exposure (specify operational details, e.g. stockpiling algorithm, grace period)	Yes	45 days grace window and 45 days risk window.
Date of add to/switch from exposure (specify algorithm)	Yes	Date of augmentation or switching from an exposure to a comparator and vice versa.
Other date (specify)	Yes	Censor upon starting any other GLP-1-RA.

[1] follow-up ends at the first occurrence of any of the selected criteria that end follow-up.

6.4.4 Context and rationale for covariates (confounding variables and effect modifiers, e.g. risk factors, comorbidities, comedications)

We identified a series of covariates that were likely confounders due to being strong risk factors for the primary outcome that were associated with choice of treatment. These include demographics, disease severity related variables, comorbid conditions, comedications, frailty, healthcare utilization and markers of health seeking behaviour.

Table 2. Operational Definitions of Covariates

Characteristics	Details	Type of variable	Assessment window	Care Settings[1]	Code Type[2]	Diagnosis Position[3]	Applied to study populations:	Measurement characteristics / validation	Source for algorithm
Demographics									
Age	Cohort entry year – year of birth, (last observed value in the baseline)	Continuous	[0, 0]	n/a	n/a	n/a	Exposure: Tirzepatide Reference: Sitagliptin	n/a	n/a

6.5 Data analysis

6.5.1 Context and rationale for analysis plan

The study will use a propensity score based overlap weighting method.[21] The propensity score will be estimated as the probability of initiating tirzepatide vs sitagliptin given the baseline patient characteristics using multivariable logistic regression models. As diagnostics for propensity score models, the study will evaluate distributional overlap, weight distribution, and covariate balance using standardized differences post-weighting. The study will estimate the hazard ratio for tirzepatide vs sitagliptin on the composite all-cause mortality or heart failure hospitalisation in the weighted population using a Cox proportional hazards model with robust standard errors.

Table 3. Primary, secondary, and subgroup analysis specification

A. Co-primary analyses

Hypothesis:	Tirzepatide decreases the risk of all-cause mortality or heart failure hospitalization in individuals with heart failure with preserved ejection fraction when following the eligibility criteria of the SUMMIT trial.
Exposure contrast:	Tirzepatide vs sitagliptin.
Outcome:	Composite of all-cause mortality or heart failure hospitalisation.
Analytic software:	Aetion, SAS 9.4, R.4.4.0
Model(s): (provide details or code)	Outcome model: Cox proportional hazards Follow-up time * status(0) = exposure
Confounding adjustment method	**Name method and provide relevant details, e.g. bivariate, multivariable, propensity score weighting (specify weighting algorithm ratio and caliper), propensity score weighting (specify weight formula, trimming, truncation), propensity score stratification (specify strata definition), other.**

	Overlap weighting based on the propensity score.
Missing data methods	**Name method and provide relevant details, e.g. missing indicators, complete case, last value carried forward, multiple imputation (specify model/variables), other.**
	Assumption that if no relevant claims diagnoses/procedures are present, the condition is not present.
Subgroup Analyses	**List all subgroups**
	Individuals <70, Individuals ≥70, Male, Female (exploratory analyses).

Hypothesis:	Tirzepatide has a similar effect on all-cause mortality or heart failure hospitalization in individuals with heart failure with preserved ejection fraction when relaxing the eligibility criteria of the SUMMIT trial (e.g., including patients with previous cardiovascular events, dyspnoea-related diagnoses, etc., to reflect a broader patient population from routine care).
Exposure contrast:	Tirzepatide vs sitagliptin.
Outcome:	Composite of all-cause mortality or heart failure hospitalization.
Analytic software:	Aetion, SAS 9.4, R.4.4.0
Model(s): **(provide details or code)**	Outcome model: Cox proportional hazards Follow-up time * status(0) = exposure
Confounding adjustment method	**Name method and provide relevant details, e.g. bivariate, multivariable, propensity score weighting (specify weighting algorithm ratio and caliper), propensity score weighting (specify weight formula, trimming, truncation), propensity score stratification (specify strata definition), other.**
	Overlap weighting based on the propensity score.
Missing data methods	**Name method and provide relevant details, e.g. missing indicators, complete case, last value carried forward, multiple imputation (specify model/variables), other.**
	Assumption that if no relevant claims diagnoses/procedures are present, the condition is not present.
Subgroup Analyses	**List all subgroups**
	Individuals <70, Individuals ≥70, Male, Female, BMI <40, BMI ≥40.

B. Secondary Analyses

Hypothesis:	Tirzepatide decreases the risk of all-cause mortality or worsening heart failure events and its individual end points (secondary outcomes) for individuals with heart failure with preserved ejection fraction in two populations: (1) patients meeting the eligibility criteria of the SUMMIT trial, and (2) a broader patient population when relaxing the eligibility criteria of the SUMMIT trial.
Exposure contrast:	Tirzepatide vs sitagliptin.

Outcome:	Composite of all-cause mortality or a worsening heart failure event (exacerbated symptoms of heart failure resulting in hospitalization, intravenous diuretic therapy in an urgent care setting), and its respective individual end points.
Analytic software:	Aetion, SAS 9.4, R.4.4.0
Model(s): **(provide details or code)**	Outcome model: Cox proportional hazards Follow-up time * status(0) = exposure
Confounding adjustment method	**Name method and provide relevant details, e.g. bivariate, multivariable, propensity score weighting (specify weighting algorithm ratio and caliper), propensity score weighting (specify weight formula, trimming, truncation), propensity score stratification (specify strata definition), other.**

Table 4. Sensitivity analyses – rationale, strengths and limitations

	What is being varied? How?	Why? (What do you expect to learn?)	Strengths of the sensitivity analysis compared to the primary	Limitations of the sensitivity analysis compared to the primary
Hernia as a negative control outcome.	We are changing the outcome to hernia for which there is expected to be no causal effect from tirzepatide.	We will evaluate the potential impact of residual confounding on this outcome for which there is not expected to be a causal effect.	Evaluates the robustness of the interpretation of the primary analysis by evaluating the potential magnitude of unmeasured confounding.	This analysis assumes that the confounding structure is the same or similar for the negative control outcome as the outcome of interest.
Lumbar radiculopathy as a negative control outcome.	We are changing the outcome to lumbar radiculopathy for which there is expected to be no causal effect from semaglutide.	We will evaluate the potential impact of residual confounding on this outcome for which there is not expected to be a causal effect.	Evaluates the robustness of the interpretation of the primary analysis by evaluating the potential magnitude of unmeasured confounding.	This analysis assumes that the confounding structure is the same or similar for the negative control outcome as the outcome of interest.
Broader definition of end point hospitalization for heart failure.	Instead of requiring an inpatient discharge diagnosis in the primary position for heart failure, we will allow an inpatient diagnosis in any position for heart failure.	Helps determine whether restricting to primary-position heart failure diagnoses omits relevant cases or whether including secondary diagnoses introduces misclassification.	Increases sensitivity for capturing hospitalizations for heart failure.	Some hospitalizations may primarily be for other conditions rather than heart failure itself.
Intention-to-treat analyses to address potential informative censoring.	To address potential informative censoring.	We will consider the first-used medication for 365 days without considering drug discontinuation or switching, mimicking an	Reflects follow-up regimen of RCT.	Persistence of drug use is shorter in clinical practice whereas adherence is typically higher in RCTs. Therefore, we expect the estimated effects will be diluted toward the null,

		"intention-to-treat" approach.		underestimating the true treatment effect had patients remained on therapy.
Apply eligibility criteria from the STEP-HFpEF DM trial[22]	To assess how variations in eligibility criteria influence the study population size and treatment effect estimates.	We will learn how slightly different eligibility criteria and their operationalization can influence treatment effect estimates.	Assesses the impact of treatment effect estimation due to differential cohort assembly.	Estimates will not be directly used to assess robustness of primary analysis.

6.5.2 Comparison of Results Between Database Studies and RCTs

We will attempt to benchmark the results of the secondary analysis from the database study against the composite end point of all-cause mortality or worsening heart failure events observed in the SUMMIT trial. It is important to note that this end point had few outcomes in the trial. Consequently, failure to replicate the RCT findings is not necessarily indicative of the inadequacy of the healthcare claims data for emulation for a range of possible reasons, nor does failure to replicate provide information about the validity of the trial result.[23] Assessment of concordance in results between the database study-trial pair will use the metrics previously implemented in the RCT-DUPLICATE initiative, namely statistical significance agreement, estimate agreement, and standardized difference agreement. In this project, "full" statistical significance agreement was defined by estimates and confidence intervals on the same side of null; estimate agreement was defined by whether estimates for the trial emulation fell within the 95% CI for the trial results; standardized difference agreement between treatment effect estimates from trials and emulations was defined by standardized differences $|Z| < 1.96$ ($Z = \frac{(\theta_{RCT} - \theta_{RWE})}{(\sqrt{\hat{\sigma}^2_{RCT} + \hat{\sigma}^2_{RWE}})}$ where are the treatment effect estimates and the $\hat{\sigma}^2$ are associated variances). In addition, "partial" significance agreement was defined as meeting pre-specified non-inferiority criteria even though a more highly powered database study may have indicated superiority.[23,24]

6.6 Data sources

6.6.1 Context and rationale for data sources

Reason for selection: The study will be conducted in 2 US health care claims databases: Optum Clinformatics (2022-2024), and Merative Marketscan (2022-2023). Data from the Merative Marketscan database will only be included if sufficient sample size can be accrued.

Strengths of data source(s): Each data source contains deidentified, longitudinal, date-stamped information on patient enrollment, demographics, inpatient/outpatient diagnosis and procedures, admission and discharge dates, and medication dispensation. The death data is captured in the Optum database from inpatient discharge status, social security death master file, and deaths scraped from obituaries or other sources. The death data in MarketScan is captured from the social security death master file and inpatient discharge status. It is recognized that the social security death master

file has high specificity and positive predictive value for deaths. While this data resource has under captured deaths since 2011, the capture of deaths is not expected to be differential between compared exposure groups. The death data is captured in the Medicare database from inpatient discharge status, and social security death master file. [25–27]

Limitations of data source(s): Patient healthcare encounters are only observable when they are enrolled in an insurance plan that contributes to the database. Patients may change insurance plans for multiple reasons. Both Optum Clinformatics and Merative MarketScan are primarily employer based insurance databases where patients may disenroll with job changes. In claims data, dispensing data for inpatient medication is unavailable. Diagnoses reflect billing practices, therefore algorithms (preferably validated) are needed for accurate phenotyping of patient conditions. Services that are not covered by insurance do not appear in the data. The trial evaluated cardiovascular deaths, however we will evaluate all-cause mortality in the emulation because most deaths in this cohort of patients at high cardiovascular risk will be related to cardiovascular reasons, the cause of death is not recorded for databases not linked to NDI, and the performance of NDI at identifying cardiovascular causes of death may be suboptimal. [27]

Data source provenance/curation:

Information about Optum Clinformatics and Merative MarketScan can be found in data dictionaries and user guides that are provided to clients.

Table 5. Metadata about data sources and software

	Data 1	Data 2
Data Source(s):	Optum Clinformatics	Merative Marketscan
Study Period:	13th May 2022	13th May 2022
Eligible Cohort Entry Period:	November 30, 2024	December 31, 2023
Data Version (or date of last update):	April 2025	Mortality Cut Set A Received 2024-03-01
Data sampling/extraction criteria:	n/a	n/a
Type(s) of data:	Administrative claims	Administrative claims

6.7 Data management

Tracking data: The Data Use Agreement (DUA) Custodian (Principal Investigator) and the Division Operations Manager (Winta Tekle) are responsible for receiving and creating a record of new data associated with the given request. The Operations Manager is responsible for all indexing and archiving of documents and electronic media related to data that the Division receives and will log data location, data contents, and associated DUA and Institutional Review Board (IRB) numbers in the Division's centralized tracking system.

Handling and storage: In-scope data will be stored utilizing Mass General Brigham approved information systems – i.e., Division servers and Mass General Brigham network storage.

Archiving: Data retention and any removal will be executed by the Division Operations Manager (Winta Tekle) and Data Manager (Todd MacGarvey). The Division follows Mass General Brigham enterprise record retention policies and follow the terms of the agreement through which the in-scope data was received.

Information security: The Division follows Mass General Brigham's Enterprise Information Security Program (EISP). The EISP helps by providing assurance that Mass General Brigham information and information systems are protected from unauthorized access, use, disclosure, duplication, modification, or destruction in order to maintain their confidentiality, integrity, and availability. To that end, the EISP policies, standards and procedures create an information security framework that is aligned with the recommendations of the International Organization for Standardization's (ISO) publication 27001 and the National Institute of Standards and Technology's (NIST) publication 800-53 Family of Controls and MGB regulatory and legal requirements (as a HIPAA covered entity).

Mass General Brigham workforce members are required to complete new workforce privacy and information security training upon hire and annually thereafter. Refresh training is provided as appropriate. Mass General Brigham workforce members are required to review and sign a Confidentiality Agreement upon hire and annually thereafter. Additionally, we follow Enterprise Information Security and Privacy policies, including Managing Workforce Members Information Security Responsibilities Policy, which was developed to help assure that Mass General Brigham workforce members are competent and eligible to support the information security responsibilities associated with their role. Mass General Brigham workforce, including Division staff, are required to comply with Enterprise Information Security and Privacy Policies.

Facilities: The research team uses a highly secure, state-of-the-art, computing facility housed at Mass General Brigham's Corporate Data Centers in Needham and Marlborough, Massachusetts as well as Amazon Web Services (AWS). We maintain redundant storage for maximal data integrity and high-speed data access.

The Division uses Mass General Brigham corporate provisioned servers to analyze and store data in connection with this project. There are strict access controls enforced by technical means to ensure that only study staff who have been approved to conduct data analyses and contracted data engineers are able to access data (e.g., Mass General Brigham Authentication (Active Directory) utilized; auditing, logging, and monitoring enabled; firewalls enabled; etc.). All Division servers used in this study are accessible to only authorized staff only through the MGB network and utilizing VPN as appropriate (i.e., users must be on the network and logged into VPN to access). Mass General Brigham has a network information security monitoring team and in-scope servers are enrolled in enterprise security tools (e.g., vulnerability scanning service, antivirus, etc.).

The Division also uses AWS. In-scope AWS services / resources have undergone review and assessment by Mass General Brigham's Information Security Risk Assessment Team/ InfoSec Risk Management Team as required and in alignment with NIST 800-30: Guide for Conducting Risk Assessments. In-scope AWS servers are for our exclusive use (reserved instances), are covered under our organization's Business Associate Agreement with AWS. In-scope servers are housed in anonymous facilities that are not branded as AWS facilities. Physical access is strictly controlled both at the perimeter and at building ingress points by professional security staff utilizing video surveillance, intrusion detection systems, and other electronic means.

Security attributes and controls for the Division's use of in-scope AWS in connection with this project include: encryption at rest and in transit (industry standard AES-256 encryption, SSL/TSL), anti-malware, latest OS updates and patches as well as anti-virus; multi-factor authentication (MFA), Identity and Access Management, including SSO; auditing and logging; principle of least privilege, including for traffic and ports (e.g., deny all default configurations), use of VPC enabled Step functions, etc.; separation between environments; minimum necessary (out of the box AWS roles are not used as they can be overly permissive); all data would reside in the US domestic regions – use only US east HIPAA compliant region; performance monitoring enabled and reviewed as per internal processes; passwords compliant with enterprise password policy and, as appropriate, more protective password requirements; etc. Our Division's AWS use is also subject to ongoing evaluation and monitoring as well – e.g., vulnerability scanning and management, access review, etc.

A data file list will be maintained in Amazon S3 and tracked through Cloudtrail and Cloudwatch. Reporting of data file availability for any file stored in an S3 bucket will be controlled by MGB.

Amazon EC2, Amazon EBS, and Amazon VPC are integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in Amazon EC2, Amazon EBS, and Amazon VPC. CloudTrail captures all API calls for Amazon EC2, Amazon EBS, and Amazon VPC as events, including calls from the console and from code calls to the APIs. MGB IT/security staff have full access to CloudTrail to ensure that CloudTrail monitoring is available at all times. Amazon CloudWatch Events delivers a near-real-time stream of system events that describe changes in AWS resources. Amazon CloudTrail can log, continuously monitor, and retain account activity related to actions across the MGB AWS infrastructure. CloudTrail provides event history of MGB AWS account activity. This event history simplifies security analysis, resource change tracking, and troubleshooting and complies with requirements to ensure the data file inventory is controlled by MGB.

Backups: Backups are created using industry recognized Cryptographic mechanisms (e.g., 256-bit AES encryption) as appropriate and required. Data are backed up within the MGB network from the MGB Needham data center to the MGB Marlborough data center via replication/mirroring and volume-level snapshots. AWS Backup supports both instance-level backups as Amazon Machine Images (AMIs) and volume-level backups as separate snapshots based on the resource tags. AMIs allow MGB IT and security staff to create backups of all S3 and EC2 instances.

In addition to the safeguards listed above, the Division follows enterprise privacy and information security policies and maintains internally procedures in connection with this project to safeguard the data in connection with this project as appropriate and required including: Physical Security and Environmental Controls for Electronic Information Policy; IT Access Control Standards for Users policy; Safeguarding Fax Copiers Printers Telephone Use and Pagers; Physical Removal and Transport of Protected Health Information and Personal Information policy, etc.

6.8 Quality control

Senior Programmers and Research Specialists perform QA/QC on raw or common data model converted data via SAS/R/Aetion software. The protocol will be iteratively developed and pre-specified data checks including feasibility counts and balance on baseline covariates will be conducted with outputs reviewed by MGB team members. Team members will review code lists to ensure fidelity to intended algorithms.

6.9 Study size and feasibility

See appendices 4[strict, relaxed] and appendices 5[strict, relaxed] (feasibility, weighting on age, sex, comorbidity score as well as all predefined propensity score variables). Propensity score distribution plots with c-statistics are available in appendices 6[strict, relaxed]. Tables 1[strict, relaxed] showing prevalence of baseline characteristics and standardized differences in distribution are available in appendices 7[strict, relaxed]. Additional diagnostic evaluations, including balance assessments of laboratory and clinical examination test results not included in the propensity score as well as assessment of heart failure-related medication after follow-up, will be conducted to assess potential residual confounding and divergence of treatment over time.

7. Limitation of the methods

As we are using secondary data and the data were not collected for research purposes, some important variables may not be collected or will be measured imperfectly. We have selected validated algorithms when possible and we have created proxies for important variables that are not directly captured in the data to reduce confounding by unmeasured factors. One measurement difference is, for example, an inclusion criterion requiring left ventricular ejection fraction (LVEF). Since these measurements are not captured in claims, we proxied LVEF by applying a predictive algorithm for LVEF with high positive predictive value (PPV) of 91%. This has been a frequently used method in other database studies.[28,29,30]

When comparing results from an RCT to a database study that emulates the design, we assume that the findings from the single RCT are internally valid. However, as the end points we intend to emulate were partly only of exploratory nature and not sufficiently powered, there might be great variability, making it potentially difficult to compare to the effect estimates reported in the trial.

Although we plan to emulate the important features of each trial as closely as possible in healthcare claims, there may be some elements of the RCT design that are not emulable with a database study, which means that the real-world evidence obtained from the database study and trial will address slightly different clinical questions. For example, in routine clinical care, adherence to treatment is typically not as high as it is in an RCT with strong measures in place to encourage adherence to the study protocol. This means that there is more discontinuation and short-term medication use in the patients identified in claims databases than trial participants.

Apparent agreement between RCT and database study results could occur if the effects of multiple factors (chance, emulation differences, bias) cancel each other out.

8. Protection of human subjects

This study has been approved by the Brigham and Women's Hospital Institutional Review Board.

	Variable_name	Details
Demographics	Age	
	Gender	
	Race*	
	Region/State	
Lifestyle risk factors	Smoking / Tobacco use	
	Overweight, if BMI is 27.0 to 29.9	
	Class 1 (low-risk) obesity, if BMI is 30.0 to 34.9	
	Class 2 (moderate-risk) obesity, if BMI is 35.0 to 39.9	
	Class 3 (high-risk) obesity if BMI is equal to or greater than 40	
	Unspecified obesity	
Diabetes complications	Diabetic retinopathy	
	Diabetic neuropathy	
	Diabetic nephropathy	
	Diabetes with other ophthalmic complications	
	Diabetes with peripheral circulatory disorders	
	Diabetic foot	
	Erectile dysfunction	
	Hypoglycemia	
	Hyperglycemia/DKA/HONK	
	Skin infections	
Cardiovascular-related conditions	Angina	
	Hypertension	
	Hypotension	
	Hyperlipidemia	
	Atrial fibrillation	
	Myocardial infarction	
	Cerebrovascular procedure	
	Coronary atherosclerosis	
	Cardiac conduction disorder	
	Previous cardiac procedure (CABG, PTCA, Stent)	
	Ischemic stroke	
	PVD diagnosis or surgery	
	Other cardiac dysrhythmia	
	Cardiomyopathy	
	Valve disorders	
	Valve replacement	
	TIA	
	Edema	
	Venous thromboembolism	
	Pulmonary hypertension	
	Insertion of pacemakers / removal of cardiac lead	
	Implantable cardioverter defibrillator	
	Hyperkalemia	
Renal-related conditions	CKD stage 1-2	
	CKD stage 3-4	
	Unspecified CKD	
	Acute kidney injury	
	Urolithiasis (kidney or urinary stones)	
	Hypertensive nephropathy	
	Urinary tract infections	
	Genital infections	
Other comorbidities	COPD	
	Asthma	
	Serious bacterial infections	
	Pneumonia	
	Influenza	
	Obstructive sleep apnea	
	Liver disease	
	MASH/MASLD	
	Hyperthyroidism and other thyroid gland disorders	
	Hypothyroidism	
	Fractures / Falls	
	Osteoporosis	
	Depression	
	Dementia	
	Delirium or psychosis	
	Anemia	
	Urinary incontinence	
	Biliary disease	
	Pancreatitis	
	Bowel obstruction	
	Gastroparesis	

Diabetes medications	Metformin	
	Insulin	
	Sulfonylureas	
	DPP4i (except sitagliptin)	
	SGLT2i	
	Other glucose-lowering drugs	
Heart failure medications	ACEi / ARB	
	ARNI	
	Thiazides	
	Beta-Blockers	
	Calcium channel blockers	
	Digoxin / Digitoxin	
	Loop diuretics	
	Other diuretics	
	Intravenous diuretics	
	Nitrates	
Other medications	Anti-arrhythmics	
	Statins	
	PCSK9 inhibitors and other lipid-lowering drugs	
	Antiplatelet agents	
	Oral anticoagulants	
	COPD/Asthma medication	
	NSAIDs	
	Oral corticosteroids	
	Osteoporosis agents (incl. bisphosphonates)	
	Opioids	
	Anti-depressants	
	Antipsychotics	
	Anxiolytics/hypnotics, benzodiazepines	
	Urinary tract infections antibiotics	
	Laxatives	
Healthcare utilization markers	Number of distinct medications, median (iqr), mean (sd)	
	Number of emergency department visit median (iqr), mean (sd)	
	Number of office visits median (iqr), mean (sd)	
	Number of endocrinologist visits, median (iqr), mean (sd)	
	Number of cardiologist visits, median (iqr), mean (sd)	
	Number of internal medicine/family medicine visits, median (iqr), mean (sd)	
	Number of electrocardiograms, median (iqr), mean (sd)	
	Number of echocardiograms, median (iqr), mean (sd)	
	Pharmacy out-of-pocket cost, median (iqr), mean (sd)	
	Unique brand medications, median (iqr), mean (sd)**	
	Unique generic medications, median (iqr), mean (sd)**	
	Ratio of unique brand to generic medications, median (iqr), mean (sd)	
Healthy behavior markers	Colonoscopy, Sigmoidoscopy	
	Flu vaccine / Pneumococcal vaccine	
	Pap smear	
	PSA test	
	Fecal Occult Blood Test	
	Bone mineral density tests	
	Mammograms	
Laboratory and diagnostic tests	Number of HbA1c tests, median (iqr), mean (sd)	
	Number of Lipid panels, median (iqr), mean (sd)	
	Number of Creatinine tests, median (iqr), mean (sd)	
	Number of Urine tests, median (iqr), mean (sd)	
Lab values	HbA1c**	If <2 or >20, then set to missing
	Glucose**	If <30, then set to missing
	Creatinine**	If <0.8, then 0.8 AND >30, then set to missing
	Systolic blood pressure**	If <30, then set to missing
	Heart rate**	If <30, then set to missing
	BMI**	If <10 or >100, then set to missing
	BNP**	If 0 or >10,000, then set to missing
	proBNP**	If 0 or >20,000, then set to missing
	eGFR**	If 0, then set to missing
Burden of comorbidities	Combined comorbidity score	
	Frailty score	
Baseline hospitalizations and hospital metrics	Number of any hospitalization, median (iqr), mean (sd)	
	0, 1, >1 hospitalizations for heart failure	
	0, 1, >1 hospitalizations for other reason	
Calendar year of cohort entry	Calendar year	

*Available for Optum Clinformatics and Medicare
**Not used in the PS model
