Title	Emulation of the RECORD1 Anticoagulation Trial in Healthcare Claims Data
Research question & Objectives	RECORD1 is a phase 3 trial comparing the efficacy and safety of rivaroxaban with enoxaparin for extended thromboprophylaxis in patients undergoing elective total hip replacement. Our objective is to emulate the design of RECORD1 using healthcare claims data and benchmark our results against the trial.

2. Abstract

This is a non-randomized, non-interventional study that is part of the *Randomized Controlled Trials Duplicated Using Prospective Longitudinal Insurance Claims: Applying Techniques of Epidemiology* (RCT-DUPLICATE) initiative (www.rctduplicate.org) of the Brigham and Women's Hospital, Harvard Medical School.

This study is part of a series that applies the Benchmark, Expand, and Calibration (BenchExCal) approach, in which an initial trial emulation is benchmarked against a completed randomized controlled trial (RCT) to inform a subsequent database study for related clinical questions or expanded indications. In this empirical example, the related clinical question has also been evaluated in a completed randomized trial, allowing comparison of the expanded database emulation with the corresponding RCT findings.^{1,2}

It is intended to emulate, as closely as is possible in healthcare insurance claims data, the RECORD1 trial described below. Although many features of the trial cannot be directly replicated in healthcare claims, key design features, including outcomes, exposures, and inclusion/exclusion criteria, were selected to proxy those features from the trial. Randomization cannot be achieved in healthcare claims data but was proxied through a statistical balancing of measured covariates according to standard practice. Investigators assume that the RCT provides guidance on the reference standard treatment effect estimate. However, failure to replicate RCT findings is not necessarily indicative of the inadequacy of the healthcare claims data for emulation for a range of possible reasons and does not provide information on the validity of the original RCT finding.

The RECORD1 trial demonstrated the efficacy of rivaroxaban, a factor Xa inhibitor, compared with enoxaparin, a low molecular weight heparin (LMWH), in patients undergoing elective total hip replacement for the composite outcome of deep-vein thrombosis, nonfatal pulmonary embolism, or death from any cause at 36 days. Efficacy was demonstrated in sequential testing of non-inferiority in the per-protocol population followed by superiority in a modified intention-to-treat analysis.³

The database study designed to emulate RECORD1 will be a new-user active comparator cohort study, conducted using three national United States claims databases, where we compare the effect of rivaroxaban vs enoxaparin on the composite outcome of deep-vein thrombosis, nonfatal pulmonary embolism, or death from any cause at 36 days after initiation of the study drug.

Optum: Eligible cohort entry period from July 1, 2011 to August 1, 2025.

Marketscan: Eligible cohort entry period from December 31, 2013 to December 1, 2023.

Medicare: Eligible cohort entry period from July 1, 2011 to December 1, 2024.

May 10, 2026	1	All sections	<p>This version of the emulation of RECORD1 is part of a demonstration project funded by FDA that aims to apply a Benchmark, Expand, and Calibrate approach. This study builds on a previous protocol for emulating RECORD1 that was developed for an earlier part of the RCT-DUPLICATE project with a different objective. The changes include:</p> <ul style="list-style-type: none"> • Refining the operational definitions of inclusion and exclusion criteria • Changing assessment windows for various design elements (e.g., covariate assessment window, eligibility criteria) of the study • Adding additional variables to the propensity score • More recently accrued data is included 	<p>This project builds on a previous version of an emulation of RECORD1 that was conducted for different objectives than this study. This protocol includes updates to align the study design with other components of the BenchExCal approach. Differences in results between the versions of RECORD1 emulations may occur due to the differences in objectives and design/implementation.</p>

4. Rationale and background

The purpose of this protocol is to specify the emulation of the RECORD1 trial (NCT00329628). Rivaroxaban (exposure) became available on July 1, 2011, when it was approved for prophylaxis of venous thromboembolism (VTE) after hip and knee arthroplasty.⁴ Apart from the approval for the prophylaxis of VTE after hip or knee arthroplasty, rivaroxaban has later also been approved for the treatment of acute and also recurrent VTE, the prevention of stroke and systemic embolism in nonvalvular atrial fibrillation, the reduction in risk of major cardiovascular events in patients with coronary artery disease (CAD) or peripheral artery disease (PAD), and in pediatric populations that require anticoagulation for prophylaxis or therapy.⁴

The RECORD1 trial enrolled 4591 participants between February 2006 and March 2007 to receive either 10 mg of oral rivaroxaban once daily, beginning after surgery, or 40 mg of enoxaparin subcutaneously once daily, beginning the evening before surgery, plus a placebo tablet or injection. The primary end point was a composite of deep-vein thrombosis, nonfatal pulmonary embolism, or death from any cause. During a follow-up period of 36 days in the per-protocol population, 13 of 1537 (0.8%) composite events occurred in the treatment group as compared to 50 of 1492 (3.4%) composite events occurred in the comparator group. This resulted in a weighted risk reduction of 2.5% (95% CI, 1.5 to 3.6) and a risk ratio of 0.25 (95% CI, 0.14 to 0.46), which demonstrated the superiority of rivaroxaban as compared with enoxaparin.^{3,5}

5. Research question and objectives

Table 1. Primary and secondary research questions and objective

A. Primary research question and objective

Objective:	To evaluate the comparative effect of rivaroxaban vs enoxaparin on the risk of deep vein thrombosis, nonfatal pulmonary embolism, or death from any cause in patients who underwent elective total hip replacement.
Hypothesis:	We hypothesize that rivaroxaban will be superior to enoxaparin with regard to thrombosis prophylaxis in patients undergoing elective total hip replacement.
Population:	Patients aged 18 years or older undergoing elective total hip replacement. Additional eligibility criteria aligned with the RECORD1 trial.
Exposure:	Rivaroxaban.
Comparator:	Enoxaparin.
Outcome:	Composite of deep-vein thrombosis, nonfatal pulmonary embolism, or death from any cause within 36 days.
Time (when follow up begins and ends):	One day after first prescription fill of either exposure or comparator until first of outcome, end of observation in data, end of study period, death, discontinuation (7 day grace window

	and risk-window), nursing home admission, augmentation/additional exposure, switch to other NOAC or warfarin.
Setting:	Study drug treatment in the outpatient setting, outcomes are considered when the occurrence is documented in inpatient care setting or death occurs.
Main measure of effect:	Risk ratio.

B. Secondary research question (Negative control outcome) and objective

Objective:	To evaluate the effect of rivaroxaban versus enoxaparin on the control outcome fractures and falls.
Hypothesis:	We hypothesize that rivaroxaban will not have a different effect from enoxaparin.
Population (mention key inclusion-exclusion criteria):	Patients aged 18 years or older undergoing elective total hip replacement. Additional eligibility criteria aligned with the RECORD1 trial.
Exposure:	Rivaroxaban.
Comparator:	Enoxaparin.
Outcome:	Fractures and falls (excluding patients with recent outcome prior to the follow-up time window (30 days)).
Time (when follow up begins and ends):	One day after first prescription fill of either exposure or comparator until first of outcome, end of observation in data, end of study period, death, discontinuation (7 day grace window and risk-window), nursing home admission, augmentation/additional exposure, switch to other NOAC or warfarin.
Setting:	Study drug treatment in the outpatient setting, outcomes are considered when the occurrence is documented in inpatient care setting.
Main measure of effect:	Risk ratio.

6. Research methods

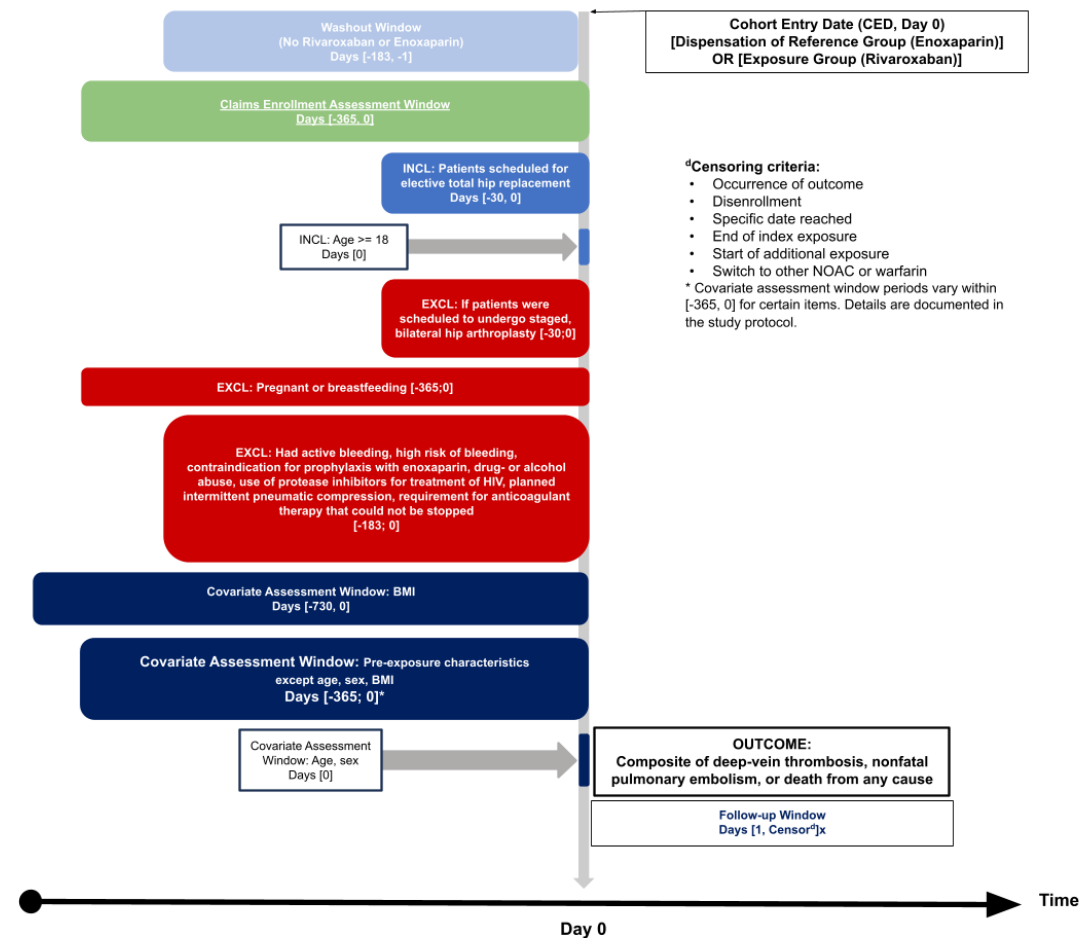

6.1 Study design

Research design (e.g. cohort, case-control, etc.): New user active comparator cohort study.

Rationale for study design choice: The new user active-comparator design may be able to address confounding by indication. It accomplishes this, in large part, through judicious selection of an appropriate active-comparator group. While selection of an appropriate comparator in the design phase is crucial, cohort studies often require additional adjustment of measurable confounders. A common method for adjusting for confounding is via a propensity score.

6.2 Study design diagram

Figure 1. Exposure-based cohort entry where the cohort entry date is selected after application of exclusion criteria.

6.3 Setting

6.3.1 Context and rationale for definition of time 0 (and other primary time anchors) for entry to the study population

Time 0 in the database study was defined to emulate randomization to treatment of rivaroxaban vs enoxaparin in the trial design. Time 0 is the day of first outpatient prescription of either of the study drugs. See appendix tables 1 and 2 for operational definitions and detailed code algorithms.

6.3.2 Context and rationale for study inclusion criteria:

Study inclusion criteria were defined to emulate the inclusion criteria for RECORD1. See appendix tables 1 and 2 for operational definitions and detailed code algorithms. A flowchart of the study cohort assembly is provided in Appendix 3.

6.3.3 Context and rationale for study exclusion criteria

Study exclusion criteria were defined to emulate the exclusion criteria for RECORD1. See appendix tables 1 and 2 for operational definitions and detailed code algorithms. A flowchart of the study cohort assembly is provided in Appendix 3.

6.4 Variables

6.4.1 Context and rationale for exposure(s) of interest

The exposure and comparator were defined to emulate the agents compared for RECORD1, rivaroxaban and enoxaparin. See appendix tables 1 and 2 for operational definitions and detailed code algorithms.

Algorithm to define duration of exposure effect:

Assuming the supply of the drug extends beyond the last day's prescription supply, we allow a 10 day gap between the dispensation (grace period) and also add 10 days at the end of the last day's supply (exposure risk window).

6.4.2 Context and rationale for outcome(s) of interest

The primary outcome for the database study was defined to emulate the primary outcome for the trial, a composite of deep-vein thrombosis, nonfatal pulmonary embolism, or death from any cause within 36 days. See appendix tables 1 and 2 for operational definitions and detailed code algorithms.

Control outcomes of interest include: Fractures/falls. This is a negative control outcome where no difference in effect is expected for rivaroxaban vs enoxaparin.

6.4.3 Context and rationale for follow up

Both on-treatment (OT) and intention-to-treat (ITT) analyses will be conducted. Adherence in clinical practice databases is expected to be much worse than in the trial, therefore the OT analysis will be the primary analysis. The OT analysis targets the risk ratio of outcomes while on treatment and may more closely emulate the effect observed in highly adherent trial participants. Both OT and ITT will be conducted at 36-day follow-up and compared to the risk ratio observed in the trial.

Table 1. Operational Definitions of follow up

The follow up starts at the day after the first outpatient prescription of the study drug

Follow up start	Day 1	
Follow up end¹	Select all that apply	Specify
Date of outcome	Yes	
Date of death	Yes	Part of the primary outcome.
End of observation in data	Yes	Date of disenrollment.
Day X following index date (specify day)	Yes	Day 36.
End of study period (specify date)	Yes	Optum: August 31, 2025; Marketscan: December 31, 2023; Medicare: December 31, 2024.
End of exposure (specify operational details, e.g. stockpiling algorithm, grace period)	Yes	10 days grace window and 10 days risk window.
Date of add to/switch from exposure (specify algorithm)	Yes	Date of augmentation or switching from an exposure to a comparator and vice versa.
Other date (specify)	Yes	Censor upon starting any other NOAC, warfarin, or nursing home admission (loss of observability).

¹ Follow up ends at the first occurrence of any of the selected criteria that end follow up.

6.4.4 Context and rationale for covariates (confounding variables and effect modifiers, e.g. risk factors, comorbidities, comedications)

We identified a series of covariates that were likely confounders due to being strong risk factors for the outcomes of interest that were associated with choice of treatment. These include demographics, disease severity related variables, comorbid conditions, comedications, frailty, healthcare utilization and markers of health seeking behaviour. Covariate coding may be subject to changes before final treatment-effect estimation if propensity score diagnostics indicate sparse cells, unstable estimates, quasi-separation, or inadequate overlap.

6.5 Data analysis

6.5.1 Context and rationale for analysis plan

The studies will use a propensity score (PS) 1:1 nearest neighbor matching with a caliper of 0.01 on the propensity score scale. The propensity score will be estimated as the probability of initiating rivaroxaban vs enoxaparin given the baseline patient characteristics using multivariable logistic regression

models. As diagnostics for PS models, the study will evaluate distributional covariate balance using standardized differences and c-statistics post-matching. The study will estimate the risk ratio for rivaroxaban vs enoxaparin on a composite DVT, PE, or death outcome in the matched population. Across all analyses, results from the three databases will be pooled via fixed effects meta-analysis.

Table 3. Primary, secondary, and subgroup analysis specification

	What is being varied? How?	Why? (What do you expect to learn?)	Strengths of the sensitivity analysis compared to the primary	Limitations of the sensitivity analysis compared to the primary
Fractures and falls as a negative control outcome.	We are changing the outcome to fractures and falls for which there is expected to be no differential causal effect from rivaroxaban or enoxaparin.	We will evaluate the potential impact of residual confounding on this outcome for which there is not expected to be a causal effect of treatment.	Evaluates the robustness of the interpretation of the primary analysis by evaluating the potential magnitude of unmeasured confounding.	This analysis assumes that the confounding structure is the same or similar for the negative control outcome as the outcome of interest.
Broader definition of primary end point.	Instead of requiring an inpatient discharge diagnosis in the primary position, we will allow an inpatient diagnosis in any position. All-cause mortality is unchanged.	Helps determine whether restricting to primary-position DVT and PE diagnoses omits relevant cases or whether including secondary diagnoses introduces misclassification.	Increases sensitivity for capturing DVT and PE.	Some hospitalizations may reflect not new, but rather previous events.

Re-weighted population distribution.	We will re-weight the population distribution of the pooled database study cohorts to reflect that of the RCT.	We will learn about potential effect modification due to different distributions of key characteristics such as age/sex in the RCT vs the database study.	The population distributions will be more aligned.	The measurement of these population characteristics may be measured differently in the RCT vs database study, with different levels of specificity and sensitivity.
Apply benchmark, expand, calibrate (BenchExCal) sensitivity and tipping point analysis.	We will use the observed difference in result from emulation of RECORD1 to recalibrate the result from the database study emulation of RECORD3 and EINSTEIN DVT. We will conduct a tipping point analysis with a range of plausible estimates of the expected difference.	We expect to learn about the performance of BenchExCal in an example where we emulate an RCT for an expanded indication and an RCT result for the expanded indication is available.	The analysis will calibrate the primary result based on expected differences due to bias and/or design emulation differences and propagate uncertainty regarding the impact of these factors into the frequentist primary result.	The ability to appropriately calibrate the result depends on how “close” the clinical context and confounding structure is between the initial and expanded indication. The approach assumes that the net effect of bias and design emulation differences is similar.

6.5.2 Comparison of Results Between Database Studies and RCTs

We will attempt to benchmark the results of the primary analysis from the database study against the primary composite end point of deep-vein thrombosis, pulmonary embolism, or death from any cause after elective total hip replacement observed in the RECORD1 trial. Consequently, failure to replicate the RCT findings is not necessarily indicative of the inadequacy of the healthcare claims data for emulation for a range of possible reasons, nor does failure to replicate provide information about the validity of the trial result.

Assessment of concordance in results between the database study-trial pair will use the metrics previously implemented in the RCT-DUPLICATE initiative, namely statistical significance agreement, estimate agreement, and standardized difference agreement. In this project, “full” statistical significance agreement was defined by estimates and confidence intervals on the same side of null; estimate agreement was defined by whether

estimates for the trial emulation fell within the 95% CI for the trial results; standardized difference agreement between treatment effect estimates from trials and emulations was defined by standardized differences $|Z| < 1.96$ ($Z = \frac{(\theta_{RCT} - \theta_{RWE})}{\sqrt{\hat{\sigma}_{RCT}^2 + \hat{\sigma}_{RWE}^2}}$ where θ are the treatment effect estimates and the $\hat{\sigma}^2$ are associated variances). In addition, “partial” significance agreement was defined as meeting pre-specified non-inferiority criteria even though a more highly powered database study may have indicated superiority.^{6,7}

6.6 Data sources

6.6.1 Context and rationale for data sources

Reason for selection: The study will be conducted in 3 US health care claims databases: Optum Clinformatics (2004-2025), Merative MarketScan (2012-2023), and Medicare (2007-2024).

Strengths of data source(s): Each data source contains deidentified, longitudinal, date-stamped information on patient enrollment, demographics, inpatient/outpatient diagnosis and procedures, admission and discharge dates, and medication dispensation. The death data is captured in the Optum database from inpatient discharge status, social security death master file, and deaths scraped from obituaries or other sources. The death data in MarketScan is captured from the social security death master file and inpatient discharge status. It is recognized that the social security death master file has high specificity and positive predictive value for deaths. While this data resource has under captured deaths since 2011, the capture of deaths is not expected to be differential between compared exposure groups. The death data is captured in the Medicare database from inpatient discharge status, and social security death master file.⁸⁻¹⁰

Limitations of data source(s): Patient healthcare encounters are only observable when they are enrolled in an insurance plan that contributes to the database. Patients may change insurance plans for multiple reasons. Both Optum Clinformatics and Merative MarketScan are primarily employer based insurance databases where patients may disenroll with job changes. Patients in Medicare may move in and out of fee-for-service plans. We are excluding person-time in health maintenance organization (HMO) plans due to concerns about the completeness of capture of diagnoses and procedures. This means that we require patients to be enrolled in Medicare parts AB and D during the baseline assessment window and censor patients if they switch to part C. In claims data, dispensing data for inpatient medication is unavailable. Diagnoses reflect billing practices, therefore algorithms (preferably validated) are needed for accurate phenotyping of patient conditions. Services that are not covered by insurance do not appear in the data. The cause of death is not recorded for databases not linked to NDI, and the performance of NDI at identifying cardiovascular causes of death may be suboptimal.¹⁰ The completeness of death ascertainment differs across the three databases. Optum captures deaths from multiple sources, including inpatient discharge status, the Social Security Death Master File, and obituary-based sources, whereas Medicare includes death information from inpatient discharge records, the Social Security Death Master File, and National Death Index linkages. In contrast, death ascertainment in MarketScan is more limited and is primarily based on inpatient discharge status, resulting in undercapture of deaths occurring outside the hospital setting. Although this limitation may reduce the sensitivity of mortality ascertainment, it is not expected to differ systematically between treatment groups and therefore is unlikely to introduce substantial differential bias in comparative effect estimates.

Data source provenance/curation: Information about Optum Clinformatics and Merative MarketScan can be found in data dictionaries and user guides that are provided to clients. Information about Medicare data provenance and curation can be found on the ResDac website.¹¹

6.7 Data management

Tracking data: The Data Use Agreement (DUA) Custodian (Principal Investigator) and the Division Operations Manager (Winta Tekle) are responsible for receiving and creating a record of new data associated with the given request. The Operations Manager is responsible for all indexing and archiving

of documents and electronic media related to data that the Division receives and will log data location, data contents, and associated DUA and Institutional Review Board (IRB) numbers in the Division's centralized tracking system.

Handling and storage: In-scope data will be stored utilizing Mass General Brigham approved information systems – i.e., Division servers and Mass General Brigham network storage.

Archiving: Data retention and any removal will be executed by the Division Operations Manager (Winta Tekle) and Data Manager (Todd MacGarvey). The Division follows Mass General Brigham enterprise record retention policies and follow the terms of the agreement through which the in-scope data was received.

Information security: The Division follows Mass General Brigham's Enterprise Information Security Program (EISP). The EISP helps by providing assurance that Mass General Brigham information and information systems are protected from unauthorized access, use, disclosure, duplication, modification, or destruction in order to maintain their confidentiality, integrity, and availability. To that end, the EISP policies, standards and procedures create an information security framework that is aligned with the recommendations of the International Organization for Standardization's (ISO) publication 27001 and the National Institute of Standards and Technology's (NIST) publication 800-53 Family of Controls and MGB regulatory and legal requirements (as a HIPAA covered entity).

Mass General Brigham workforce members are required to complete new workforce privacy and information security training upon hire and annually thereafter. Refresh training is provided as appropriate. Mass General Brigham workforce members are required to review and sign a Confidentiality Agreement upon hire and annually thereafter. Additionally, we follow Enterprise Information Security and Privacy policies, including Managing Workforce Members Information Security Responsibilities Policy, which was developed to help assure that Mass General Brigham workforce members are competent and eligible to support the information security responsibilities associated with their role. Mass General Brigham workforce, including Division staff, are required to comply with Enterprise Information Security and Privacy Policies.

Facilities: The research team uses a highly secure, state-of-the-art, computing facility housed at Mass General Brigham's Corporate Data Centers in Needham and Marlborough, Massachusetts as well as Amazon Web Services (AWS). We maintain redundant storage for maximal data integrity and high-speed data access.

The Division uses Mass General Brigham corporate provisioned servers to analyze and store data in connection with this project. There are strict access controls enforced by technical means to ensure that only study staff who have been approved to conduct data analyses and contracted data engineers are able to access data (e.g., Mass General Brigham Authentication (Active Directory) utilized; auditing, logging, and monitoring enabled; firewalls enabled; etc.). All Division servers used in this study are accessible to only authorized staff only through the MGB network and utilizing VPN as appropriate (i.e., users must be on the network and logged into VPN to access). Mass General Brigham has a network information security monitoring team and in-scope servers are enrolled in enterprise security tools (e.g., vulnerability scanning service, antivirus, etc.).

The Division also uses AWS. In-scope AWS services / resources have undergone review and assessment by Mass General Brigham's Information Security Risk Assessment Team/ InfoSec Risk Management Team as required and in alignment with NIST 800-30: Guide for Conducting Risk Assessments. In-scope AWS servers are for our exclusive use (reserved instances), are covered under our organization's Business Associate Agreement with AWS. In-scope servers are housed in anonymous facilities that are not branded as AWS facilities. Physical access is strictly controlled

both at the perimeter and at building ingress points by professional security staff utilizing video surveillance, intrusion detection systems, and other electronic means.

Security attributes and controls for the Division's use of in-scope AWS in connection with this project include: encryption at rest and in transit (industry standard AES-256 encryption, SSL/TSL), anti-malware, latest OS updates and patches as well as anti-virus; multi-factor authentication (MFA), Identity and Access Management, including SSO; auditing and logging; principle of least privilege, including for traffic and ports (e.g., deny all default configurations), use of VPC enabled Step functions, etc.; separation between environments; minimum necessary (out of the box AWS roles are not used as they can be overly permissive); all data would reside in the US domestic regions – use only US east HIPAA compliant region; performance monitoring enabled and reviewed as per internal processes; passwords compliant with enterprise password policy and, as appropriate, more protective password requirements; etc. Our Division's AWS use is also subject to ongoing evaluation and monitoring as well – e.g., vulnerability scanning and management, access review, etc.

A data file list will be maintained in Amazon S3 and tracked through Cloudtrail and Cloudwatch. Reporting of data file availability for any file stored in an S3 bucket will be controlled by MGB.

Amazon EC2, Amazon EBS, and Amazon VPC are integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in Amazon EC2, Amazon EBS, and Amazon VPC. CloudTrail captures all API calls for Amazon EC2, Amazon EBS, and Amazon VPC as events, including calls from the console and from code calls to the APIs. MGB IT/security staff have full access to CloudTrail to ensure that CloudTrail monitoring is available at all times. Amazon CloudWatch Events delivers a near-real-time stream of system events that describe changes in AWS resources. Amazon CloudTrail can log, continuously monitor, and retain account activity related to actions across the MGB AWS infrastructure. CloudTrail provides event history of MGB AWS account activity. This event history simplifies security analysis, resource change tracking, and troubleshooting and complies with requirements to ensure the data file inventory is controlled by MGB.

Backups: Backups are created using industry recognized Cryptographic mechanisms (e.g., 256-bit AES encryption) as appropriate and required. Data are backed up within the MGB network from the MGB Needham data center to the MGB Marlborough data center via replication/mirroring and volume-level snapshots. AWS Backup supports both instance-level backups as Amazon Machine Images (AMIs) and volume-level backups as separate snapshots based on the resource tags. AMIs allow MGB IT and security staff to create backups of all S3 and EC2 instances.

In addition to the safeguards listed above, the Division follows enterprise privacy and information security policies and maintains internally procedures in connection with this project to safeguard the data in connection with this project as appropriate and required including: Physical Security and Environmental Controls for Electronic Information Policy; IT Access Control Standards for Users policy; Safeguarding Fax Copiers Printers Telephone Use and Pagers; Physical Removal and Transport of Protected Health Information and Personal Information policy, etc.

6.8 Quality control

Senior Programmers and Research Specialists perform QA/QC on raw or common data model converted data via SAS/R/Aetion software. The protocol will be iteratively developed and pre-specified data checks including feasibility counts and balance on baseline covariates will be conducted with outputs reviewed by MGB team members. Team members will review code lists to ensure fidelity to intended algorithms.

6.9 Study size and feasibility

See appendix 4 (first feasibility matching on age, sex, comorbidity score) and appendix 5 (second feasibility matching on all predefined propensity score variables). Propensity score distribution plots with c-statistics are available in appendix 6. Table 1 showing prevalence of baseline characteristics and standardized differences in distribution are available in appendix 7.

7. Limitation of the methods

As we are using secondary data and the data were not collected for research purposes, some important variables may not be collected or will be measured imperfectly. We have selected validated algorithms when possible and we have created proxies for important variables that are not directly captured in the data to reduce confounding by unmeasured factors.

When comparing results from an RCT to a database study that emulates the design, we assume that the findings from the single RCT are internally valid.

Although we plan to emulate the important features of each trial as closely as possible in healthcare claims, there may be some elements of the RCT design that are not emulable with a database study, which means that the real-world evidence obtained from the database study and trial will address slightly different clinical questions. For example, in routine clinical care, adherence to treatment is typically not as high as it is in an RCT with strong measures in place to encourage adherence to the study protocol. This means that there is more discontinuation and short-term medication use in the patients identified in claims databases than trial participants.

Apparent agreement between RCT and database study results could occur if the effects of multiple factors (chance, emulation differences, bias) cancel each other out.

8. Protection of human subjects

This study has been approved by the Brigham and Women's Hospital Institutional Review Board.
