1. INTRODUCTION

The following Statistical Analysis Plan (SAP) provides the outline for the statistical analysis of the data collected from the LUM-201-04 study (protocol version 2.0 dated 19 January 2022).

The planned analyses identified in this SAP may be included in clinical study reports (CSRs), regulatory submissions, or future manuscripts. Also, post hoc exploratory analyses not necessarily identified in this SAP may be performed to further examine study data. Any post hoc, or unplanned, exploratory analyses performed will be clearly identified as such in the final CSR.

Important features of the analysis including the methods used, adjustments made for demographic or baseline measurements or concomitant therapy, handling of dropouts and missing data, adjustments for multiple comparisons, special analyses of multicenter studies, and adjustments for interim analyses, should be discussed.

2. PROJECT OVERVIEW

2.1 Study Design

This is a multiple center, 12-month, open-label in children with growth hormone deficiency (GHD) who completed 12 months of recombinant human growth hormone (rhGH) treatment in the LUM-201-01 Trial. Up to 20 subjects will be enrolled.

Following successful screening, subjects will be assigned to the 3.2 mg/kg daily oral dose of LUM-201. IGF-1 samples will be collected throughout the study. If an insulin-like growth factor 1 (IGF-1) standard deviation score (SDS) value $> +2.0$ is confirmed by a follow-up (unscheduled) lab, the LUM-201 dose may be reduced to 1.6 mg/kg/day.

The follow-up safety history of subjects will be collected by telephone visit 30 days after their final visit.

2.2 Study Objectives and Endpoints

Categories	Objectives	Endpoints
Primary objective	The primary objective(s) of this study is assessing the growth response to LUM-201 administration in children with idiopathic growth hormone deficiency (GHD) previously treated with daily rhGH for 12 months in the LUM-201-01 trial.	Growth parameters of efficacy (Month 6 [visit 4] and Month 12 [visit 6]) will be assessed based on: <ol style="list-style-type: none">1. Annualized height velocity.2. Change in HT-SDS3. Change in Weight and Weight SDS4. Change in BMI and BMI SDS

		<p>5. Change in Bone Age (Only Month 6 [visit 4])</p> <p>PD:</p> <p>Serum LUM-201 PD markers including growth hormone (GH), IGF-1, and IGFBP-3 concentrations. IGF-1 SDS will be calculated from measured IGF-1 concentrations</p>
Secondary objective(s)	The secondary objective(s) of this study is assessing safety in response to LUM-201 treatment.	<p>Safety of LUM-201 will be assessed by AEs and SAEs, routine laboratory tests (hematology, chemistry panel including liver enzymes and urinalysis), HbA1c, blood glucose, free thyroxine (T4), triiodothyronine (T3), thyroid-stimulating hormone (TSH), lipids, physical examinations, ECGs and vital signs</p>

2.3 Sample Size

Up to 20 subjects may enter this study.

2.4 Randomization

Not applicable for this open-label study.

3. STATISTICAL CONSIDERATIONS

Data will be handled and processed per the sponsor's representative (Novotech) Standard Operating Procedures (SOPs), which are written based on the principles of good clinical practice (GCP).

3.1 General Considerations

All data collected on the electronic case report form (eCRF) will be presented in the data listings and will be listed and sorted by treatment group where applicable. All descriptive summaries will be presented by the treatment group and nominal visit/time point (where applicable).

All safety summaries will be presented by the treatment group. All disposition and, concomitant medication descriptive summaries will be presented by treatment sequence and nominal visit/time point (where applicable).

Unless otherwise stated, the following methods will be applied:

- Continuous variables: Descriptive statistics will include the number of non-missing values (n), arithmetic mean, standard deviation (SD), standard error (SE), median, minimum, and maximum values.

The minimum and maximum values will be displayed to the same decimal precision as the source data, the arithmetic mean, SD, and median values will be displayed to one more decimal than the source data for the specific variable.

95% Confidence Intervals (CIs), mean differences (among treatments and from baseline) and least-square (LS-Means) values will be displayed to one more decimal than the source data for a specific variable. P-values will be displayed to 3 decimal places.

The appropriate precision for derived variables will be determined based on the precision of the data on which the derivations are based, and statistics will be presented in accordance with the above mentioned rules.

- Categorical variables: Descriptive statistics will include counts and percentages per category. The denominator in all percentage calculations will be the number of participants in the relevant analysis population with non-missing data, unless specifically stated otherwise. Percentages will be displayed to one decimal place. Proportions will be displayed to 3 decimal places.

95% Confidence Intervals (CIs), difference in proportions, odds ratio's and other categorical parameters will be displayed to one decimal place for percentages. Proportions will be displayed to 3 decimal places. P-values will be displayed to 3 decimal places.

- Repeat/unscheduled assessments: Only values collected at scheduled study visits/time points will be presented in summary tables. If a repeat assessment was performed, the result from the original assessment will be presented as the result at the specific visit/time point. All collected data will be included in the data listings.
- Result display convention: Results will be center aligned in all summary tables and listings. Participant identifiers visit and parameter labels may be left-aligned if required.
- Date and time display conventions: The following display conventions will be applied in all outputs where dates and/or times are displayed:

Date only: YYYY-MM-DD

Date and time: YYYY-MM-DD HH:MM

If only partial information is available, unknown components of the date or time will be presented as 'NK' (not known), i.e., '2016-NK-NK'. Times will be reported in military time.

3.2 Key Definitions

The following definitions will be used:

- Baseline: The baseline value is defined as the last available valid (quantifiable continuous or categorical value), non-missing observation for each participant prior to first study drug administration. Repeat and unscheduled assessments will be included in the derivation of the baseline values.
- Change from Baseline: The change from baseline value is defined as the difference between the result collected/derived at a post-baseline visit/time point and the baseline value.

The change from baseline value at each post-baseline visit/time point will be calculated for all continuous parameters using the following formula:

$$\text{Change from Baseline Value} = \text{Result at Visit/Time Point} - \text{Baseline Value}$$

The change from baseline value will only be calculated if the specific post-baseline visit/time point result and the baseline value for the parameter are both available and will be treated as missing otherwise.

- Study day: The study day of an event is defined as the relative day of the event starting with the date of the first study drug administration (reference date) as Day 1 (there will be no Day 0).

The study day of events occurring before the first study drug administration will be calculated as:

$$\text{Study Day} = (\text{Date of Event} - \text{Date of First Study Drug Administration})$$

For events occurring on or after Day 1, study day will be calculated as:

$$\text{Study Day} = (\text{Date of Event} - \text{Date of First Study Drug Administration}) + 1$$

Study days will only be calculated for events with complete dates and will be undefined for events that are 'Ongoing' at the end of the study.

Relative days compared to an alternative reference point will be calculated similarly, but the alternative starting reference start date will be used instead of the date of the first study drug dosing.

- Prior Medications: Prior medications are defined as any medication where the use was stopped prior to the first administration of the study medication.
- Concomitant Medications: Concomitant medications are defined as any medication (other than the study drug) that was used at least once after the first administration of the study drug. Medications that were stopped on the same date as the first study drug administration will be defined as concomitant medications. If a clear determination cannot be made (partial medication end dates) the medication will be classified as concomitant
- Treatment Emergent Adverse Events (TEAEs) are defined as adverse events that occurred following the first administration of study medication.
- Standard Deviation Scores (SDS) for height, weight, and BMI will be computed using the WHO 2007 Child Growth Standards available from the World Health Organization (WHO)

website. SDS for IGF-1 will be computed using reference standards for healthy children, based on IGF-1 concentration values provided by the central laboratory.

- Growth response including change in HT-SDS, change in Weight and Weight-SDS, change in BMI and BMI-SDS, and change in Bone Age (baseline data from previously study last visit data, this study only collected Month 6 data).
- Puberty is defined as Tanner Stage 2 breast development in girls and testicular volumes \geq 4 mL in boys.

3.3 Inferential Analyses

Descriptive statistics will be used to summarize the safety data. No formal hypothesis testing is planned.

3.4 Multiple Comparisons and Multiplicity Adjustments.

Not applicable for this study.

3.5 Handling of Missing Data

For height related endpoints, missing results will be imputed by carrying the last non-missing height value forward and using this value to derive HV and HT-SDS at the analysis time points. This is a conservative estimate of HV and change in HT-SDS, as it assumes no further change in height after the last measurement.

For the classification of Treatment emergent adverse event (TEAE) and Concomitant medication, the following will be applied in the following order:

- a. If all dates/times (start and stop) are missing, the event/medication will automatically be classified as a TEAE/Concomitant medication.
- b. For AEs with a missing start date/time, if the event end date/time is prior to first study drug administration, the event will not be classified as a TEAE.
- c. If only the AE start year/ medication end year is present and is the same or is after the first study drug administration year unit, the event/medication will be classified as a TEAE/Concomitant medication.
- d. If the AE start month and year/medication end month and year are present and are the same or after the first study drug administration month and year units, the event/medication will be classified as a TEAE/Concomitant medication.

3.6 Coding of Events and Medications

Medical history and AE verbatim terms will be coded using the Medical Dictionary for Regulatory Activities (MedDRA) using version 23.1 at the time of study commencement. Terms will be coded to the full MedDRA hierarchy, but the system organ class (SOC) and preferred terms (PT) will be of primary interest for the analysis.

Prior and concomitant medications will be coded using the World Health Organization Drug Dictionary using 2020 Q3 at the time of study commencement. Medications will be mapped to the full WHO-DD Anatomical Therapeutic Chemical (ATC) class hierarchy, but PTs will be of primary interest in this analysis.

3.7 Treatment Groups

- LUM-201 3.2 mg/kg/day

4. ANALYSIS POPULATIONS (ANALYSIS SETS)

In this study 3 analysis populations are defined: The Safety, the Intent-to-Treat (ITT), and the Per-Protocol (PP) population.

4.1 Population Descriptions

1. Intent To Treat (ITT) Population (Full Analysis Set)

The Full Analysis Set includes all enrolled subjects who have received at least one dose of study treatment. This set will be used for the safety analysis.

All disposition and demographic data analysis will be based on the ITT population. All listings will be presented by the ITT population.

2. Per Protocol (PP) population (Analysis Set)

The Per Protocol Population includes all enrolled subjects who complete Month 12 (visit 6) and have not missed more than 10% of scheduled doses and who do not have any major protocol deviations.

The Per Protocol Population will be used for the primary evaluation, the growth response to treatment.

Pharmacodynamic (PD) markers including GH, IGF-1, and IGFBP-3 concentrations.

5. SUMMARY OF STUDY DATA

5.1 Participant disposition and analysis populations

Participant disposition and analysis population analysis will be based on the ITT population. Participant disposition and analysis populations will be summarized descriptively as described in section 3.1 (categorical descriptive analysis).

a. Participant Disposition

Participant disposition will include the number of participants who completed the study as planned, participants withdrawn from the study, as well as the primary reason for early termination. Participant disposition will be summarized descriptively.

A listing of patient disposition with study discontinuation and treatment discontinuation will be presented. Whether a patient had any ongoing AEs, the date of last dose, reason for treatment discontinuation (if applicable), date of last contact (or date of death) and date of withdrawal of consent (if applicable) will be included.

Listings will be provided by treatment groups (section 3.7) sorted by participant ID for all enrolled participants along with the date the participant provided informed consent, date and

time of first/last received study treatment, and date of last visit, whether the participant completed the study and reason for early withdrawal.

b. Analysis Populations

The number of participants included in each study populations will be summarized descriptively.

In addition, the inclusion of each participant into/from each of the defined analysis populations will be presented in the by-participant data listings.

Listings will be provided by treatment groups (section 3.7) sorted by participant ID for all enrolled participants, along with the date and time of first study drug administration, date of last visit, and whether the participant completed the study.

5.2 Protocol deviations

All major protocol deviations will be categorized and summarized descriptively, as per data collected based on ITT population. Protocol deviations will be presented for each participant in the by-participant data listings. Listing of all protocol deviations and the details will be provided by treatment group (section 3.7) sorted by participant ID for ITT population.

Prior to database lock, all protocol deviations will be reviewed by medical monitors and assigned a status of major or minor if qualifying as such.

Protocol deviations and major protocol deviations will be categorized and provided by sponsor.

5.3 Demographic and baseline information

Demographic and baseline information analysis will be based on the ITT population. Demographic and baseline information will be summarized descriptively as described in section 3.1.

Demographics and Baseline Characteristics

The following demographic and baseline characteristic parameters will be analyzed:

Continuous descriptive analysis:

- Age (months)
- Height (cm): height is the average of the three height measurements collected.
 - Height-SDS: SDS values is calculated using WHO growth charts
 - Target Height-SDS
- Weight (kg)
 - Birth weight and gestational age
 - Birth weight percentile for gestational age
 - Weight-SDS: SDS values is calculated using WHO growth charts
- BMI (kg/m^2)
 - BMI-SDS: SDS values is calculated using WHO growth charts

- Bone Age (years): measured at Month 6
- Baseline IGF-1 and IFG-1 SDS
- Maternal and paternal heights for calculation of mid-parental height (MPH)

Categorical descriptive analysis:

- Sex
- Race
- Ethnicity
- Tanner Stage

5.4 Medical history

Medical history will be coded using the MedDRA® version 23.1. Participants with any medical history will be summarized by SOC and PT using descriptive statistics in accordance with section 3.1 for the safety population by treatment groups. Medical history will be ordered from the highest frequency in the overall column by SOC and PT.

Medical history listings will be provided by treatment grouping (section 3.7) sorted by participant ID for the ITT population.

5.5 Treatment exposure

Treatment exposure will be summarized using descriptive statistics in accordance with section 3.1 based on the PP Population.

All study drug administration information (date and start and end time of administration, total dose administered, tablet strength, total number of tablets), whether dose details will be presented in the by-participant data listings and sorted by participant ID and visit for the PP population, as well as the dates and times of study drug administration.

5.6 Concomitant medications

Concomitant medications will be summarized by Anatomical Therapeutic Chemical (ATC) class Level 3 and PT as noted in section 3.1 (categorical descriptive analysis) using ITT population. Participant who used the same medication on multiple occasions will only be counted once in the specific category (PT). PTs will be sorted alphabetically. In addition to the summaries by the coded terms, the number of participants who used at least one concomitant medication during the study will be presented.

Listing of full details of concomitant medications will be provided by treatment group (section 3.7) sorted by participant ID and visit for the ITT population, sequence number, concomitant medications/therapy classification.

6. EFFICACY

All efficacy analysis will be based on the Per Protocol population.

Efficacy endpoints will be summarized descriptively as described in section 3.1 (continuous descriptive analysis).

Descriptive statistics will be compiled for 6-month and 12-month AHV, change in HT-SDS, change in weight and weight SDS, change in BMI and BMI SDS and change in bone age. In addition, these measures will be estimated from least square means from a General Linear Model with age, Baseline HT-SDS, and bone age delay as covariates.

Target HT-SDS will be computed from the observed maternal and paternal heights, their height SDS as determined from the WHO Child Growth Standards, and the calculation method of Hermanussen and Cole [4].

To calculate the Target HT-SDS, the formula is defined as follows,

Target Height-SDS = MPH-SDS (derived using WHO growth chart values at age = 228 months).

AHV at Month 12 that is < 70% of the 1st year growth on rhGH will be summarized. The AHV at the time point t2 is defined as follows,

$$\left(\frac{h_2 - h_1}{t_2 - t_1} \right) 365.25,$$

where h_2 and h_1 are the heights (cm) measured at t_2 and t_1 (in days), respectively. Of note, h_1 is the height measured at Baseline visit (visit 1).

Derivation of IGF-1 SDS values

Inputs:

1. IGF-1 concentration values from the central lab.
2. CRF collect sex and age in months at the screening visit and date of the screening visit.
3. Date at which the IGF-1 sample was drawn.
4. LMS tables (female and male) were provided from sponsor.

Method:

1. Determine IGF-1 concentration in units of ng/mL from the laboratory results in original results. If the original results are in nmol/L, convert to ng/mL using the conversion calculation below. DO NOT round result value.

$$X \text{ ng/mL} = Y \text{ nmol/L} * 7.63$$

2. Derive age at Visit in Half Years using the calculations below.

$$\text{age at visit} = \frac{(\text{age at screening} * 30.44) + (\text{visit date} - \text{screening date} + 1)}{365.25}$$

$$\text{age at visit in half years} = \frac{\text{floor}(\text{age at visit} * 2)}{2}$$

3. Merge data with LMS tables by sex and age at visit in half years, to obtain values for the following LMS parameter: lambda(λ), mu(μ), and sigma(σ).
4. Calculate SDS values from the LMS parameter values using calculation below.

$$SDS = round\left(\frac{((X \text{ ng/mL})/\mu)^\lambda - 1}{\lambda * \sigma}, 0.001\right)$$

5. Incorporate normal ranges for the SDS values:
 - a. $X < -2.0$ = Low
 - b. $-2.0 < X < 2.0$ = Normal
 - c. $X > 2.0$ = High

6.1 Estimand

No estimand is planned for this study.

6.2 Pharmacodynamic (PD) markers

PD endpoints (Serum IGF-1, IGFBP-3 and GH) will be summarized descriptively as described in continuous descriptive analysis.

7. SAFETY

Safety endpoints will be analyzed using the ITT population. Safety endpoints will be summarized descriptively as described in section 3.1.

7.1 Adverse Events

All AEs and SAEs including will be coded using MedDRA version 23.1. All AE summaries will be restricted to TEAEs only. Summary tables will include the number of participants (%) experiencing an event and the number of events. Participants will be counted only once for each SOC and PT level (categorical descriptive analysis).

The TEAE summaries will include:

- Overall summary of TEAEs.
 - Number of TEAEs
 - Number of Serious TEAEs
 - Number of Study Treatment Related TEAE
 - Number of TEAE Leading to Study Drug Interrupted
 - Number of TEAE Leading to Study Discontinuation
 - Number of TEAE Leading to Death
- Summary of TEAEs by SOC and PT.

- Summary of Serious TEAEs by SOC and PT.
- Summary of TEAEs by SOC, PT and Severity.
- Summary of Serious TEAEs by SOC, PT and Severity.
- Summary of TEAEs by SOC, PT and Relationship to Study Drug.
- Summary of Serious TEAEs by SOC, PT and Relationship to Study Drug.
- Summary of TEAEs Leading to the Study Drug Discontinuation by SOC and PT.
- Summary of TEAEs Leading to Death by SOC and PT

All AEs will be listed and will include the verbatim term, PT, SOC, severity (CTCAE v5.0 grades), SAE/TEAE flag, action taken with regards to the study drug for AE, outcome and other information captured in the CRF. Separate listings will be created for SAEs. These listings will be presented by treatment group (section 3.7) sorted by participant ID and AE start date along with age, sex of the participant for the ITT population.

7.2 Safety Laboratory Assessments

Blood and urine samples will be collected at the time points specified in the Schedule of Events (refer to the Protocol) to conduct hematology, chemistry and urinalysis (including microscopic examinations) analyses.

Laboratory parameters will be summarized by treatment group (section 3.7) using descriptive statistics at baseline and at each on-study evaluation, also including the change from baseline. Shift tables for laboratory parameters will be produced showing the number and percentage of subjects with changes to or from the normal range (e.g., normal to low, normal to high, low to normal, etc.) from baseline to each subsequent visit.

The clinical laboratory tests (Hematology, Serum Chemistry, Urinalysis and other test) will be performed within each of the specified test panels (refer to the Protocol section 19.3 Appendix 3: Clinical Laboratory Analytes).

All laboratory data collected at scheduled and unscheduled visits will be included in the listings, but only results collected as scheduled visits will be included in the summary tables.

Results for individual parameters may be reported in different units depending on the analyzing laboratory. If required, the results (and the corresponding normal range cut-off values) for individual parameters may be converted to International System of Units (S.I.) units to summarize the data.

For all the parameters where a unit value has been reported, the parameter names that will be used in the outputs will comprise of the test name and the unit of measure, for example, 'Albumin (g/L)'. For the urinalysis parameters, the parameter name will be the reported test name only. Parameters will be sorted alphabetically within tables and listings.

For all parameters where a normal range limit value was reported, the normal range will be derived based on the available lower and upper limit values and any reported mathematical symbols. If both a lower and upper limit value is available, the normal range will be presented as '(Lower, Upper)'.

The reported results for each parameter with a defined normal range will be classified ('Low', 'Normal', 'High') in relation to the defined normal range limits. If a result is equal to the normal range cut-off value, the result will be considered 'Normal'. If laboratory assays values below the lower limit of quantification will be treated as 0 for statistical summaries.

The hematology and chemistry results tables will present summary statistics for each laboratory parameter within the specific test panel. For each parameter, summaries will be presented for the baseline and each scheduled post-baseline visit. In addition, summaries will be presented for the change from baseline values at each scheduled post-baseline visit (continuous descriptive analysis).

The decimal precision to which the summaries for each parameter will be based on the maximum number of decimals to which the reported result or the normal range limits are presented to in the raw data. The results and normal ranges will be displayed to the same decimal precision in the listings.

Additionally, counts (%) of number participants with values out of normal range at each scheduled time point will also be presented along with shift tables that will represent the changes in normal range categories across post-baseline time points (categorical descriptive analysis).

The urinalysis table will present counts and percentages of normal, abnormal clinically significant and clinically significant for the reported results at baseline and each post-baseline visit for all parameters (categorical descriptive analysis).

7.3 Vital Signs

The following vital signs measurements will be taken at the time points specified in the Schedule of Events (refer to the Protocol):

- Pulse (beats/min);
- Systolic blood pressure (SBP) (mmHg)
- Diastolic blood pressure (DBP) (mmHg)
- Respiratory rate (breaths/min)
- Temperature (°C)

All vital signs data collected at scheduled and unscheduled visits will be included in the listings, but only results collected as scheduled visits will be included in the summary tables.

The parameter names that will be used in the outputs will comprise of the test name and the unit of measure, for example, 'Systolic Blood Pressure (mmHg)'. Parameters will be sorted in the order that the measurements were collected in on the Vital Signs eCRF page within the tables and listings.

Vital signs measurements will present summary statistics for the results at the baseline and each scheduled post-baseline visit for each of the parameters. In addition, summaries will be presented for the change from baseline values at each scheduled post-baseline visit (continuous descriptive analysis).

The decimal precision to which the summaries for each parameter will be presented will be based on the maximum number of decimals to which the results were reported on the eCRF.

7.4 12-Lead Electrocardiogram (ECG)

The following ECG measurements will be taken at the time points specified in the Schedule of Events (refer to the Protocol):

- Heart Rate (beats/min)
- PR Interval (msec)
- QT Interval (msec)
- QTcF Interval (msec)
- QRS Duration (msec)
- Overall Interpretation

All ECG data collected at scheduled and unscheduled visits will be included in the listings, but only results collected as scheduled visits will be included in the summary tables.

The parameter names that will be used in the outputs will comprise of the test name and the unit of measure, for example, 'Ventricular Rate (beats/min)'. Parameters will be sorted in the order that the measurements were collected in on the ECG eCRF page within the tables and listings.

ECG measurements will present summary statistics for the results at the baseline and each scheduled post-baseline visit for each of the parameters. In addition, summaries will be presented for the change from baseline values at each scheduled post-baseline visit (continuous descriptive analysis).

If multiple tracings are done as part of one assessment, the mean of the three tracings per parameter and the worst clinical interpretation per timepoint will be summarized for each participant. All values will be listed including the mean value per parameter and the worst clinical interpretation. Changes from baseline will be calculated based on the mean values of the triplicates where appropriate.

The decimal precision for each parameter will be based on the maximum number of decimals to which the results were reported on the eCRF.

The summary of overall interpretation findings table will present counts and percentages for the reported results at baseline and each post-baseline visit/time point. Result categories will be ordered as 'Normal ECG', 'Otherwise Normal ECG', and 'Abnormal ECG' (categorical descriptive analysis).

7.5 Physical Examinations

Complete physical examination will be performed at Baseline and Month 12 visits. Tanner staging of pubertal development will be performed at Screening/Baseline (visit 1), Month 3 (visit 3), Month 6 (visit 4), Month 9 (visit 5) and Month 12 (visit 6). Tanner staging to include breast development, pubic and axillary hair and, in males, testicular volumes.

For each body system, an assessment is being made as to whether the body system is normal, abnormal and clinically significant and abnormal but not clinically significant.

Counts and percentages for each the body system classified into: normal, abnormal and clinically significant and abnormal but not clinically significant at each scheduled visit will be summarized for ITT population for treatment groups defined in section 3.7.

The listing of physical examinations will include all the information collected, with baseline value flagged.

7.6 Pregnancy Test Results

All information related to pregnancy testing (urine and serum based) and contraception status will be presented in the by-participant data listings.

8. IMMUNOGENICITY

Not applicable.

9. CHANGES TO THE PLANNED ANALYSIS

Not applicable.

10. FINAL ANALYSIS (END OF STUDY)

The final analysis will be conducted after all participants have completed the study, the clinical database has been locked, the analysis populations have been approved.

The final analysis will be based on the final version of the SAP. Any deviations from the planned analysis will be documented in the CSR.

11. SOFTWARE

- SAS® Version 9.2 or higher (SAS Institute, Cary, North Carolina, USA).

GENERAL COMMENTS

- Where a count is 0, the percentage will not be shown (e.g. 0(0.0%)) will be displayed as 0) and statistical values (mean, median, SD, etc.) are represented as 0.
- Unless otherwise states, parameters will be listed in alphabetical order.
- The minimum and maximum values will be presented to the same number of decimal places as recorded in the electronic Case Report Form (eCRF)
- Mean, SD, and Median will be presented to one more decimal place than the raw data
- Percentages will be rounded to one decimal place, with the denominator being the number of subjects in the relevant population with non-missing data, unless otherwise specified
- Change from Baseline:
Change from Baseline will be calculated as:
Change from Baseline = post baseline value – baseline value
- Unscheduled visits will be excluded from summary tables but included in all by-participant listings.
- **Names and order of Treatment Groups**
 - LUM-201 3.2 mg/kg/day
- **Names of visits**
 - Screening/Baseline/Visit 1
 - Month 1/Visit 2
 - Month 3/Visit 3
 - Month 6/Visit 4
 - Month 9/Visit 5
 - Month 12/Visit 6/Early Withdrawal
 - Follow up
 - Unscheduled (Listing only)
- Column widths and text-wrapping may be altered in final output in order to best present the data.
- Footnotes may be added/amended if required.

Document History- <Amendment 1.0> / <Addendum x.x>**Following Tables /Listings are added :**

e.g. L16.2.8.4, L16.2.8.5

Reason for additional / update for existings

TFL number	Title
T14.2.13 Added the new table using Month 6 bone age data from Lumos-201-01 as baseline for Lumos-201-04. These additions were made due to the absence of baseline bone age data in Lumos-201-04.	Summary of Bone Age and Change from Baseline
L16.2.6.5 Added the new listing using Month 6 bone age data from Lumos-201-01 as baseline for Lumos-201-04. These additions were made due to the absence of baseline bone age data in Lumos-201-04.	Bone Age

Source Listing: 16.2.1.1, 16.2.1.2.

Note: Percentages are calculated (the denominator used for the calculation) based on the number of enrolled participants (N).

[1] Intent-to-treat Population (Intent to Treat) consists of all enrolled participants who have received at least one dose of study treatment.

[2] Per Protocol population consists of all enrolled participants who complete month 12 (visit 6) and have not missed more than 10% of scheduled doses and who do not have any significant protocol deviations.

Table 14.1.1.2 Summary of Protocol Deviations
(Intent to Treat Population)

		LUM-201
		3.2 mg/kg/day (N=xx)
		n (%)
Participants with at Least One PD		
By PD Severity

Source Listing: 16.2.4.1

SD: Standard Deviation. SE: Standard Error. MPH: Mean Parental Height
Note: Percentages are calculated (the denominator used for the calculation) based on the number of participants in Intent to Treat population who received at least one dose of study treatment (N).
[1] Height is the average of the three height measurements collected. SDS values for height, weight, and BMI are calculated using WHO 2007 Child Growth Standards charts.
[2] Target Height-SDS will be computed from the observed maternal and paternal height, their height SDS are calculated using WHO Child Growth Standards charts. Target Height-SDS = MPH-SDS, MPH-SDS is derived using WHO growth chart values at age=228 months.
[3] Body Mass Index(kg/m²) = weight (kg)/height (m)²
[4] IGF-1 SDS values are provided by the laboratory and are derived from the IGF-1 concentration using the formula specified in the SAP.
[5] MPH = average of the parental heights +6.5 cm (for boys) or -6.5 cm (for girls).

Table 14.1.4 Treatment Exposure (Per Protocol Population)

Parameter	Statistic	LUM-201 3.2 mg/kg/day (N=xx)
Treatment Duration (days)	n	xx
	Mean (SD)	xx.xx (xx.xxx)
	SE	xx.xxx
	Median	xx.x

	PT 1	xx (xx.x%)	x
	PT 2	xx (xx.x%)	x
		xx (xx.x%)	x
	...	xx (xx.x%)	x
ATC 2		xx (xx.x%)	x
	PT 1	xx (xx.x%)	x
	PT 2	xx (xx.x%)	x
.....			

Source: Listing 16.2.4.3

Prior medications are defined as any medication where the use was stopped prior to the first administration of the study medication. If a participant has multiple occurrences of a concomitant medication, the participant is presented only once in the participant count (n) column for a given ATC and PT. Occurrences are counted each time in the mentions/occurrence (m) column.

Percentages are calculated (the denominator used for the calculation) based on the number of participants in the Intent to Treat population (N)
World Health Organization-Drug Dictionary WHODrug Global Version Q3, 2020

Programming Note: Table will be sorted by ATC/PT alphabetically.

Table 14.1.1.7 Summary of Concomitant Medications
(Intent to Treat Population)

Anatomical Therapeutic Class (ATC) [Level 3] Preferred Term (PT)	LUM-201	
	3.2 mg/kg/day (N=xx)	n (%) m
Subjects with at least one Concomitant Medication

	xx (xx.x%)	x
.....		

Source: Listing 16.2.4.4

Concomitant medications are defined as any medication (other than the study drug) that was used at least once after the first administration of the study drug. If a participant has multiple occurrences of a concomitant medication, the participant is presented only once in the participant count (n) column for a given ATC and PT. Occurrences are counted each time in the mentions/occurrence (m) column.

Percentages are calculated (the denominator used for the calculation) based on the number of participants in the Intent to Treat population (N)
World Health Organization-Drug Dictionary WHODrug Global Version Q3, 2020

Programming Note: Table will be sorted by ATC/PT alphabetically.

...

Source: Listing 16.2.6.1

AHV: Annualized Height Velocity. SD: Standard Deviation. SE: Standard Error. Min: Minimum. Max: Maximum. N/A: Not Applicable. LOCF: Last Observation Carried Forward.

Height is the average of the three height measurements collected.

LOCF imputation method was applied to missing height data, up to and including Month 12.

[1] AHV at the time point t2 is defined by $((h2-h1) / (t2-t1)) * 365.25$, where h2 and h1 are the heights (cm) measured at t2 and t1 (in days), respectively.

[2] Baseline is defined as Day 1 to Month 6.

N/A: Not Applicable.

[1] Baseline is defined as the last available, valid, non-missing observation prior to first study drug administration. For baseline, the number of participants (n) will be used as the denominator for the calculation of all percentages.

For post-baseline percentage calculations, use the number of subjects who classified the results at baseline as the denominator. **Programming Note:** Need to present data for Urinalysis parameters as appropriate (Protein, Glucose, Blood, Ketones, Leukocytes) at all scheduled visits and sorted by parameters alphabetically.

Table 14.3.5.1 Summary of Vital Signs and Change from Baseline

		Month 6	YYYY-MM-DD	xxx.x	xx.xx	XX
		Month 12	YYYY-MM-DD	xxx.x	xx.xx	XX
...						

AHV: Annualized Height Velocity. SDS: Standard Deviation Scores. LOCF: Last Observation Carried Forward.

LOCF imputation method was applied to missing height data, up to and including Month 12.

AHV value is calculated at the time point t2 is defined by ((h2-h1) / (t2-t1)) * 365.25, where h2 and h1 are the heights (cm) measured at t2 and t1 (in days), respectively.

Height-SDS is calculated using World Health Organization (WHO) 2007 Child Growth Standards charts.

Listing 16.2.6.2 Weight (Per Protocol Population)

Treatment Arm: LUM-201 3.2 mg/kg/day

Participant ID/Sex	Sex/Age (months)	Visit	Date of Assessment (YYYY-MM-DD)	Weight (kg)	Change in Weight (kg)	Weight-SDS

N/A: Not Applicable. CS: Clinically Significant, NCS: Not Clinically Significant.
[1] Baseline is defined as the last available valid, non-missing observation prior to first study drug administration
Programming note: Repeat using the same format by replacing the relevant parameters and parameters sorted by parameters alphabetically.

Listing 16.2.9.2 12-Lead Electrocardiograms (Intent to Treat Population)

Treatment Arm: LUM-201 3.2 mg/kg/day
Parameter: xxxxxxxx (mmHg)

Participant ID/Sex	Visit	Time Point	Performed/ If No, Reason	Assessment	
				Date/ Time (YYYY-MM-DD/ HH:MM)	Actual Value
XXXXXXXX/Male	Screening (Baseline) [1]	Pre-Dose	Yes	YYYY-MM-DD/ HH:MM	Xx/xx
		1 hour	Yes	YYYY-MM-DD/ HH:MM	Xx/xx
	Month 1			YYYY-MM-DD/ HH:MM	Xx/xx
	Month x		Yes	YYYY-MM-DD/ HH:MM	Xx/xx
	Month x		No/xxxx		
...	Screening		Yes	YYYY-MM-DD/ HH:MM	Xx/xx

N/A: Not Applicable. CS: Clinically Significant, NCS: Not Clinically Significant.
"Otherwise Normal" is noted as the overall interpretation on and ECG when minor findings are noted, but do not warrant an "Abnormal" interpretation.
[1] Baseline is defined as the last available valid, non-missing observation prior to first study drug administration
Programming note: Repeat using the same format by replacing the relevant parameters and parameters sorted by parameters alphabetically.

Listing 16.2.9.3 Physical Examination (Intent to Treat Population)

Treatment Arm: LUM-201 3.2 mg/kg/day

Participant ID/Sex	Visit	Performed/ If No, Reason	Assessment Date (YYYY-MM-DD)	Body System	Result	Description of Abnormality
XXXXXXXX/Male	Screening (Baseline)	Yes	YYYY-MM-DD	General Appearance	Normal	
			YYYY-MM-DD	HEENT	Abnormal, CS	YYYYYYYYYY
			YYYY-MM-DD	Mouth	Normal	
			YYYY-MM-DD	Skin	Normal	
	Month x	Yes	YYYY-MM-DD	...		
			YYYY-MM-DD	General Appearance	Normal	
			YYYY-MM-DD	HEENT	Normal	
XXXXXXXX/Male	Screening (Baseline)	Yes	YYYY-MM-DD	Mouth	Normal	
			YYYY-MM-DD	Skin	Normal	
			YYYY-MM-DD	...	Normal	
			YYYY-MM-DD	General Appearance	Normal	
			YYYY-MM-DD	HEENT	Not done	
		No/xxxx	YYYY-MM-DD	Mouth	Abnormal, NCS	zzzzzzzzzzzz
			YYYY-MM-DD	Skin	Normal	
			YYYY-MM-DD	...		
			YYYY-MM-DD	...		
			YYYY-MM-DD			

HEENT: Head, Eyes, Ears, Nose, Throat. CS: Clinically Significant, NCS: Not Clinically Significant.

Listing 16.2.9.4 Tanner Stage (Intent to Treat Population)

Treatment Arm: LUM-201 3.2 mg/kg/day									
Participant ID/Sex	Visit	Tanner Staging Performed/ If No, Reason	Assessment Date (YYYY-MM-DD)	Breast Development Stage Assessed	Testicular Volume Assessed (ml)	Public Hair Development			
XXXXXXX/Male	Screening (Baseline)	Yes	YYYY-MM-DD		x.x	III			
	Month 3	No/xxxxx							
	Month x	Yes	YYYY-MM-DD		x.x	III			
	Month x	Yes	YYYY-MM-DD		x.x	III			
XXXXXXX/Female	Month x	Yes	YYYY-MM-DD		x.x	III			
	Screening (Baseline)	Yes	YYYY-MM-DD	II
