## 2. Abstract

This is a non-randomized, non-interventional study that is part of the *Randomized Controlled Trials Duplicated Using Prospective Longitudinal Insurance Claims: Applying Techniques of Epidemiology* (RCT-DUPLICATE) initiative ([www.rctduplicate.org](http://www.rctduplicate.org)) of the Brigham and Women's Hospital, Harvard Medical School. It is intended to assess the comparative effectiveness of

1. Tirzepatide vs dulaglutide,
2. Semaglutide vs sitagliptin,
3. Tirzepatide vs semaglutide

on cardiovascular outcomes in individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with type 2 diabetes (T2DM) and overweight but might not meet the eligibility criteria of pivotal RCTs for each drug (SUSTAIN-6 and SURPASS-CVOT trials), used to support regulatory approval in patients at cardiovascular risk.<sup>1,2</sup> Although many features of the target trials cannot be directly replicated in healthcare claims, key design features, including outcomes, exposures, and inclusion/exclusion criteria, were selected to proxy those features from the target trial. Randomization cannot be achieved in healthcare claims data but was proxied through a statistical balancing of measured covariates according to standard practice.

The three database studies will be new-user active-comparative studies, conducted using 3 national United States claims databases, where we compare the effect of semaglutide vs sitagliptin (used as an active comparator placebo proxy), tirzepatide vs dulaglutide, and tirzepatide vs semaglutide on the composite end point of all-cause mortality, myocardial infarction, or stroke. Clinical guidelines during the study period recommended both tirzepatide and semaglutide for the same indications of glucose lowering and weight reduction.

The study will use three data sources: Optum Clinformatics, Merative MarketScan, and Medicare.

Optum: Study period between January 1, 2018 to February 28, 2025.

MarketScan: Study period between January 1, 2018 to December 31, 2023.

Medicare: Study period between January 1, 2018 to December 31, 2020.

## 3. Amendments and updates

Version date	Version number	Section of protocol	Amendment or update	Reason
October 5, 2025	3	6.5 (Table 5: Sensitivity analysis)	Added a sensitivity analysis examining the on-treatment effect of an extended follow-up of up to 2 years.	This analysis was done at the request of a reviewer who was concerned about the comparative effect beyond the follow-up time of the primary analysis.

August 10, 2025	2	4, 5A and 5B, 6.2 6.4.2 6.5.1	<p>Add composite outcomes that exclude death as a component or single end point from the comparison of injectable semaglutide vs sitagliptin.</p> <p>Add additional subgroups of interest: Coronary heart disease, Cardiomyopathy, Valve disorders, Heart failure, Concomitant high-intensity lipid-lowering therapy.</p>	<p>Benchmarking analyses for the emulation of SUSTAIN-6 comparing injectable semaglutide to sitagliptin (a placebo-proxy) revealed disagreement in the comparison of the secondary outcome of all-cause mortality between the database study and trial, potentially due to residual confounding. The results for the primary and other secondary benchmarked outcomes were closely concordant. This study focuses on an expanded patient population compared to the SUSTAIN-6 trial. Due to concerns about bias, we will view the results of outcomes that include mortality for comparisons of injectable semaglutide with sitagliptin with scepticism. For the comparison of injectable semaglutide vs sitagliptin in an expanded population, we will add and evaluate different composite cardiovascular outcomes which exclude all-cause mortality, e.g. major adverse cardiovascular events (myocardial infarction and stroke), as well as the composite of heart failure hospitalization and urgent care visits requiring IV diuretics. Because benchmarking of the primary composite MACE outcome as well as component outcomes (including mortality) for the SURPASS-CVOT trial emulation indicated concordance in results, we will not add or evaluate additional composite outcomes that remove mortality for comparisons of tirzepatide vs dulaglutide or tirzepatide vs dulaglutide.</p>

## 4. Rationale and background

The purpose of this protocol is to specify three target trials assessing the comparative effectiveness of

1. the dual glucose-dependent insulinotropic polypeptide (GIP) and glucagon-like peptide-1 receptor agonist (GLP-1-RA) tirzepatide vs the GLP-1-RA dulaglutide,
2. the GLP-1-RA semaglutide vs the dipeptidyl peptidase-4 (DPP-4) inhibitor sitagliptin (used as an active comparator placebo proxy),
3. the GIP and GLP-1-RA tirzepatide vs the GLP-1-RA semaglutide

on major adverse cardiovascular outcomes (MACE), defined as the composite end point of all-cause mortality, myocardial infarction, or stroke in patients typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with type 2 diabetes and overweight who might not have met strict eligibility criteria of the pivotal RCTs SUSTAIN-6 and SURPASS-CVOT. The results for all-cause mortality or composite outcomes that include death will be viewed with scepticism for the comparison of injectable semaglutide vs sitagliptin because a benchmarking database study designed to emulate the SUSTAIN-6 trial using Optum and MarketScan data yielded divergent results for the mortality outcome.

Injectable semaglutide became available on December 5, 2017 under the brand name Ozempic.<sup>3</sup> On January 16, 2020, the approval was expanded to include cardiovascular risk reduction in adults with type 2 diabetes mellitus and known heart disease. On March 28, 2022, Novo Nordisk received FDA approval for a higher-dose semaglutide (2 mg) to provide improved glycemic control for adults with type 2 diabetes mellitus. Meanwhile, semaglutide received its first FDA approval for the treatment of obesity in adults under the brand name Wegovy on June 4, 2021. On December 23, 2022, the approval was extended to include teenagers aged 12 and older. Later, on March 8, 2024, Wegovy was additionally approved for cardiovascular risk reduction in people with overweight or obesity and established cardiovascular disease. On January 28, 2025, Ozempic became the first and only GLP-1-RA approved to reduce the risk of worsening kidney disease and cardiovascular death in adults with Type 2 diabetes and chronic kidney disease.

Sitagliptin was specifically chosen as an active comparator that could proxy for placebo because a major randomized controlled trial on cardiovascular outcomes demonstrated that it does not affect the cardiovascular outcomes under investigation.<sup>4</sup> This contrasts with other DPP4i such as saxagliptin, which has raised concerns regarding potential increased risks of heart failure,<sup>5-8</sup> and linagliptin, which is commonly prescribed for patients with renal impairment because it does not require dose modifications based on kidney function, potentially leading to increased confounding compared to sitagliptin.<sup>9,10</sup> Sodium-glucose Cotransporter-2 (SGLT2) inhibitors would not be a neutral comparator, as they significantly reduce clinically important kidney events, kidney failure, and cardiovascular events.<sup>11-14</sup> Sulfonylureas (SUs), though inexpensive and widely used, are a poor comparator in cardiovascular outcome studies due to their association with hypoglycemia, weight gain, and channeling bias, as they are often prescribed to elderly, lower socioeconomic status patients with higher baseline cardiovascular risk, making direct comparisons to GLP-1-RAs less reliable.<sup>15</sup>

The GIP/GLP-1-RA tirzepatide became available on May 13, 2022, when it was approved to treat type 2 diabetes mellitus.<sup>16</sup> A year later, on November 8, 2023 tirzepatide was approved for chronic weight management in adults with obesity or overweight who also have at least one weight-related comorbid condition, such as hypertension, dyslipidemia, type 2 diabetes mellitus, obstructive sleep apnea, or cardiovascular disease. Later on, on December 20, 2024, tirzepatide was approved to treat moderate to severe obstructive sleep apnea (OSA) in adults with obesity, to be used in combination with a reduced-calorie diet and increased physical activity.

Dulaglutide was approved on September 18, 2014 to improve glycemic control in adults with T2DM. On February 21, 2020 FDA approved dulaglutide to reduce the risk of major adverse cardiovascular events in adults with T2DM who have established CVD or multiple cardiovascular risk factors. In the same year, on March 9, 2020 an additional dosing regimen was approved. Finally, on November 17, 2022, dulaglutide was approved for use in pediatric patients aged 10 years and older.

## 5. Research question and objectives

**Table 2. Primary and secondary research questions and objectives**

### **A. Primary research questions and objectives: Tirzepatide vs dulaglutide**

<b>Objective:</b>	To evaluate the comparative effect of tirzepatide vs dulaglutide on the composite of all-cause mortality, myocardial infarction, or stroke in patients typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with type 2 diabetes and overweight.
<b>Hypothesis:</b>	We hypothesize that tirzepatide will be non-inferior to dulaglutide at preventing all-cause mortality, myocardial infarction, or stroke in individuals with low, moderate, or high cardiovascular risk, T2DM, and overweight. In addition, superiority to dulaglutide will be tested if non-inferiority is achieved.
<b>Population (mention key inclusion-exclusion criteria):</b>	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM and overweight.
<b>Exposure:</b>	Tirzepatide.
<b>Comparator:</b>	Dulaglutide.
<b>Outcome:</b>	Composite of all-cause mortality, myocardial infarction, or stroke.
<b>Time (when follow-up begins and ends):</b>	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, nursing home admission, or start of any other GLP-1-RA.
<b>Setting:</b>	The outcome will be measured from inpatient hospitalizations and death.
<b>Main measure of effect:</b>	Hazard ratio.

### **A. Co-primary research questions and objectives: Injectable semaglutide vs sitagliptin**

<b>Objective:</b>	To evaluate the comparative effect of injectable semaglutide vs sitagliptin on the composite of all-cause mortality, myocardial infarction, or death in patients typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with type 2 diabetes and overweight.
<b>Hypothesis:</b>	We hypothesize that injectable semaglutide is superior to sitagliptin at preventing all-cause mortality, myocardial infarction, or stroke in individuals with low, moderate, or high cardiovascular risk, T2DM, and overweight. Results from this analysis will be viewed with scepticism in light of a benchmarking database study designed to emulate the SUSTAIN-6 trial that yielded divergent results for the mortality outcome.
<b>Population (mention key inclusion-exclusion criteria):</b>	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM and overweight.
<b>Exposure:</b>	Injectable semaglutide.
<b>Comparator:</b>	Sitagliptin.
<b>Outcome:</b>	Composite of all-cause mortality, myocardial infarction, or stroke.
<b>Time (when follow-up begins and ends):</b>	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, nursing home admission, or start of any other GLP-1-RA (including oral semaglutide).
<b>Setting:</b>	The outcome will be measured from inpatient hospitalizations and death.
<b>Main measure of effect:</b>	Hazard ratio.

<b>Objective:</b>	To evaluate the comparative effect of injectable semaglutide vs sitagliptin on the composite of myocardial infarction or stroke in patients typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with type 2 diabetes and overweight.
<b>Hypothesis:</b>	We hypothesize that injectable semaglutide is superior to sitagliptin at preventing myocardial infarction or stroke in individuals with low, moderate, or high cardiovascular risk, T2DM, and overweight.
<b>Population (mention key inclusion-exclusion criteria):</b>	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM and overweight.
<b>Exposure:</b>	Injectable semaglutide.
<b>Comparator:</b>	Sitagliptin.
<b>Outcome:</b>	Composite of myocardial infarction or stroke.
<b>Time (when follow-up begins and ends):</b>	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, nursing home admission, or start of any other GLP-1-RA (including oral semaglutide).
<b>Setting:</b>	The outcome will be measured from inpatient hospitalizations.
<b>Main measure of effect:</b>	Hazard ratio.

### A. Primary research questions and objectives: Tirzepatide vs injectable semaglutide

<b>Objective:</b>	To evaluate the comparative effect of tirzepatide vs semaglutide on the composite of all-cause mortality, myocardial infarction, or stroke in patients typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with type 2 diabetes and overweight.
<b>Hypothesis:</b>	We hypothesize that tirzepatide will be non-inferior to semaglutide at preventing all-cause mortality, myocardial infarction, or stroke in individuals with low, moderate, or high cardiovascular risk, T2DM, and overweight. In addition, superiority to semaglutide will be tested if non-inferiority is achieved.
<b>Population (mention key inclusion-exclusion criteria):</b>	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM and overweight.
<b>Exposure:</b>	Tirzepatide.
<b>Comparator:</b>	Injectable semaglutide.
<b>Outcome:</b>	Composite of all-cause mortality, myocardial infarction, or stroke.
<b>Time (when follow-up begins and ends):</b>	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, nursing home admission, or start of any other GLP-1-RA (including oral semaglutide).
<b>Setting:</b>	The outcome will be measured from inpatient hospitalizations and death.
<b>Main measure of effect:</b>	Hazard ratio.

### B. Secondary research questions and objectives: Tirzepatide vs dulaglutide

<b>Objective:</b>	To evaluate the comparative effect of tirzepatide vs dulaglutide on the individual components of the primary endpoint, i.e., all-cause mortality, myocardial infarction, or stroke in patients typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with type 2 diabetes and overweight.
<b>Hypothesis:</b>	We hypothesize that tirzepatide will be non-inferior to dulaglutide at preventing all-cause mortality, myocardial infarction, or stroke in individuals with low, moderate, or high cardiovascular risk, T2DM, and overweight. In addition, superiority to dulaglutide will be tested if non-inferiority is achieved.
<b>Population (mention key inclusion-exclusion criteria):</b>	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM and overweight.
<b>Exposure:</b>	Tirzepatide.
<b>Comparator:</b>	Dulaglutide.

<b>Outcome:</b>	Individual components of the primary endpoint, i.e., all-cause mortality, myocardial infarction, or stroke.
<b>Time (when follow-up begins and ends):</b>	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, nursing home admission, or start of any other GLP-1-RA.
<b>Setting:</b>	The outcome will be measured from inpatient hospitalizations and death.
<b>Main measure of effect:</b>	Hazard ratio.

<b>Objective:</b>	To evaluate the comparative effect of tirzepatide vs dulaglutide on all-cause mortality, hospitalization for heart failure, or urgent heart failure visits in patients typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with type 2 diabetes and overweight.
<b>Hypothesis:</b>	We hypothesize that tirzepatide will be non-inferior to dulaglutide at preventing all-cause mortality and total heart failure events requiring hospitalization and/or urgent heart failure visits in individuals with low, moderate, or high cardiovascular risk, T2DM, and overweight. In addition, superiority to dulaglutide will be tested if non-inferiority is achieved.
<b>Population (mention key inclusion-exclusion criteria):</b>	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM and overweight.
<b>Exposure:</b>	Tirzepatide.
<b>Comparator:</b>	Dulaglutide.
<b>Outcome:</b>	Composite of all-cause mortality, hospitalization for heart failure, or urgent heart failure visits requiring intravenous diuretics.
<b>Time (when follow-up begins and ends):</b>	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, nursing home admission, or start of any other GLP-1-RA.
<b>Setting:</b>	The outcome will be measured from inpatient hospitalizations, intravenous diuretic therapy in an outpatient setting, and death.
<b>Main measure of effect:</b>	Hazard ratio.

<b>Objective:</b>	To evaluate the comparative effect of tirzepatide vs dulaglutide on the safety outcome of urinary tract infections in patients typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with type 2 diabetes and overweight.
<b>Hypothesis:</b>	We hypothesize that tirzepatide will not have a different effect from dulaglutide.

<b>Population (mention key inclusion-exclusion criteria):</b>	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM and overweight.
<b>Exposure:</b>	Tirzepatide.
<b>Comparator:</b>	Dulaglutide.
<b>Outcome:</b>	Urinary tract infections.
<b>Time (when follow-up begins and ends):</b>	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, nursing home admission, or start of any other GLP-1-RA.
<b>Setting:</b>	The outcome will be measured using diagnosis codes in an inpatient or outpatient setting that are followed by an antibiotic prescription within 7 days of the diagnosis code.
<b>Main measure of effect:</b>	Hazard ratio.

<b>Objective:</b>	To evaluate the comparative effect of tirzepatide vs dulaglutide on the safety outcome of serious bacterial infections in patients typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with type 2 diabetes and overweight.
<b>Hypothesis:</b>	We hypothesize that tirzepatide will not have a different effect from dulaglutide.
<b>Population (mention key inclusion-exclusion criteria):</b>	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM and overweight.
<b>Exposure:</b>	Tirzepatide.
<b>Comparator:</b>	Dulaglutide.
<b>Outcome:</b>	Serious bacterial infections.
<b>Time (when follow-up begins and ends):</b>	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, nursing home admission, or start of any other GLP-1-RA.
<b>Setting:</b>	The outcome will be measured using primary diagnosis codes in an inpatient setting.
<b>Main measure of effect:</b>	Hazard ratio.

<b>Objective:</b>	To evaluate the comparative effect of tirzepatide vs dulaglutide on the safety outcome of gastrointestinal adverse events in patients typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with type 2 diabetes and overweight.
<b>Hypothesis:</b>	We hypothesize that tirzepatide will not have more events compared to dulaglutide.

<b>Population (mention key inclusion-exclusion criteria):</b>	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM and overweight.
<b>Exposure:</b>	Tirzepatide.
<b>Comparator:</b>	Dulaglutide.
<b>Outcome:</b>	Gastrointestinal adverse events.
<b>Time (when follow-up begins and ends):</b>	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, nursing home admission, or start of any other GLP-1-RA.
<b>Setting:</b>	The outcome will be measured using diagnosis codes in an inpatient and outpatient setting.
<b>Main measure of effect:</b>	Hazard ratio.

<b>Objective:</b>	To evaluate the effect of tirzepatide vs dulaglutide on negative control outcomes, (1) hernia and (2) lumbar radiculopathy in patients typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with type 2 diabetes and overweight.
<b>Hypothesis:</b>	We hypothesize that tirzepatide will not have a different effect from dulaglutide.
<b>Population (mention key inclusion-exclusion criteria):</b>	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM and overweight. In addition, patients will be excluded with recent hernia or lumbar radiculopathy prior to the follow-up time window (30 days) when studying the negative outcome hernia or lumbar radiculopathy, respectively.
<b>Exposure:</b>	Tirzepatide.
<b>Comparator:</b>	Dulaglutide.
<b>Outcome:</b>	Separate analyses for hernia and lumbar radiculopathy.
<b>Time (when follow-up begins and ends):</b>	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, nursing home admission, or start of any other GLP-1-RA.
<b>Setting:</b>	The outcome will be measured using diagnosis codes in an inpatient or outpatient setting.
<b>Main measure of effect:</b>	Hazard ratio.

<b>Objective:</b>	To evaluate the comparative effect of injectable semaglutide vs sitagliptin on the safety outcome of serious bacterial infections in patients typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with type 2 diabetes and overweight.
<b>Hypothesis:</b>	We hypothesize that injectable semaglutide will not have a different effect from sitagliptin.
<b>Population (mention key inclusion-exclusion criteria):</b>	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM and overweight.
<b>Exposure:</b>	Injectable semaglutide.
<b>Comparator:</b>	Sitagliptin.
<b>Outcome:</b>	Serious bacterial infections.
<b>Time (when follow-up begins and ends):</b>	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, nursing home admission, or start of any other GLP-1-RA (including oral semaglutide).
<b>Setting:</b>	The outcome will be measured using primary diagnosis codes in an inpatient setting.
<b>Main measure of effect:</b>	Hazard ratio.

<b>Objective:</b>	To evaluate the comparative effect of injectable semaglutide vs sitagliptin on the safety outcome of gastrointestinal adverse events in patients typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with type 2 diabetes and overweight.
<b>Hypothesis:</b>	We hypothesize that injectable semaglutide will not have more events compared to sitagliptin.
<b>Population (mention key inclusion-exclusion criteria):</b>	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM and overweight.
<b>Exposure:</b>	Injectable semaglutide.
<b>Comparator:</b>	Sitagliptin.

<b>Outcome:</b>	Gastrointestinal adverse events.
<b>Time (when follow-up begins and ends):</b>	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, nursing home admission, or start of any other GLP-1-RA (including oral semaglutide).
<b>Setting:</b>	The outcome will be measured using diagnosis codes in an inpatient and outpatient setting.
<b>Main measure of effect:</b>	Hazard ratio.

<b>Objective:</b>	To evaluate the effect of injectable semaglutide vs sitagliptin on negative control outcomes, including (1) hernia and (2) lumbar radiculopathy in patients typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with type 2 diabetes and overweight.
<b>Hypothesis:</b>	We hypothesize that semaglutide will not have a different effect from sitagliptin.
<b>Population (mention key inclusion-exclusion criteria):</b>	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM and overweight. In addition, patients will be excluded with recent hernia or lumbar radiculopathy prior to the follow-up time window (30 days) when studying the negative outcome hernia or lumbar radiculopathy, respectively.
<b>Exposure:</b>	Injectable semaglutide.
<b>Comparator:</b>	Sitagliptin.
<b>Outcome:</b>	Separate analyses for hernia and lumbar radiculopathy.
<b>Time (when follow-up begins and ends):</b>	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, nursing home admission, or start of any other GLP-1-RA (including oral semaglutide).
<b>Setting:</b>	The outcome will be measured using diagnosis codes in an inpatient or outpatient setting.
<b>Main measure of effect:</b>	Hazard ratio.

#### **B. Secondary research questions and objectives: Tirzepatide vs injectable semaglutide**

<b>Objective:</b>	To evaluate the comparative effect of tirzepatide vs injectable semaglutide on the individual components of the primary endpoint, i.e., all-cause mortality, myocardial infarction, or stroke in patients typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with type 2 diabetes and overweight.
<b>Hypothesis:</b>	We hypothesize that tirzepatide will be non-inferior to injectable semaglutide at preventing all-cause mortality, myocardial infarction, or stroke in individuals with low, moderate, or high cardiovascular risk, T2DM, and overweight. In addition, superiority to sitagliptin will be tested if non-inferiority is achieved.

<b>Population (mention key inclusion-exclusion criteria):</b>	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM and overweight.
<b>Exposure:</b>	Tirzepatide.
<b>Comparator:</b>	Injectable semaglutide.
<b>Outcome:</b>	Individual components of the primary endpoint, i.e., all-cause mortality, myocardial infarction, or stroke.
<b>Time (when follow-up begins and ends):</b>	1 day after cohort entry date until the first of outcome, disenrollment, end of study period, discontinuation (45 days grace and risk window), switch between the arms, nursing home admission, or start of any other GLP-1-RA (including oral semaglutide).
<b>Setting:</b>	The outcome will be measured from inpatient hospitalizations and death.
<b>Main measure of effect:</b>	Hazard ratio.

<b>Objective:</b>	To evaluate the comparative effect of tirzepatide vs injectable semaglutide on all-cause mortality, hospitalization for heart failure, or urgent heart failure visits in patients typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with type 2 diabetes and overweight.
<b>Hypothesis:</b>	We hypothesize that tirzepatide will be non-inferior to injectable semaglutide at preventing all-cause mortality and total heart failure events requiring hospitalization and/or urgent heart failure visits in individuals with low, moderate, or high cardiovascular risk, T2DM, and overweight. In addition, superiority to semaglutide will be tested if non-inferiority is achieved.
<b>Population (mention key inclusion-exclusion criteria):</b>	Individuals typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with T2DM and overweight.

## 6. Research methods

### 6.1 Study design

**Research design (e.g. cohort, case-control, etc.):** New user active-comparator cohort study.

**Rationale for study design choice:** The new user active-comparator design is a powerful design that may be able to address confounding by indication. It accomplishes this, in large part, through judicious selection of an appropriate active-comparator group.<sup>17,18</sup> While selection of an appropriate comparator in the design phase is crucial, cohort studies often require additional adjustment of measurable confounders. A common method for adjusting for confounding is via a propensity score.

6.2 Study design diagrams for the comparison of tirzepatide vs dulaglutide, semaglutide vs sitagliptin, and tirzepatide vs semaglutide.

Figure 1. Study diagram for the comparison tirzepatide vs dulaglutide.

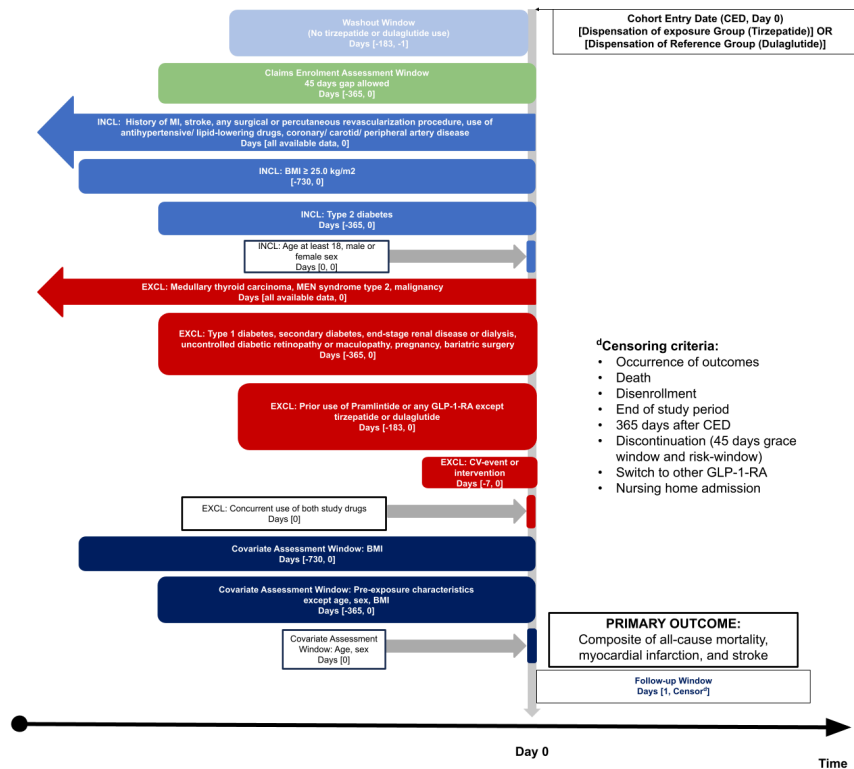

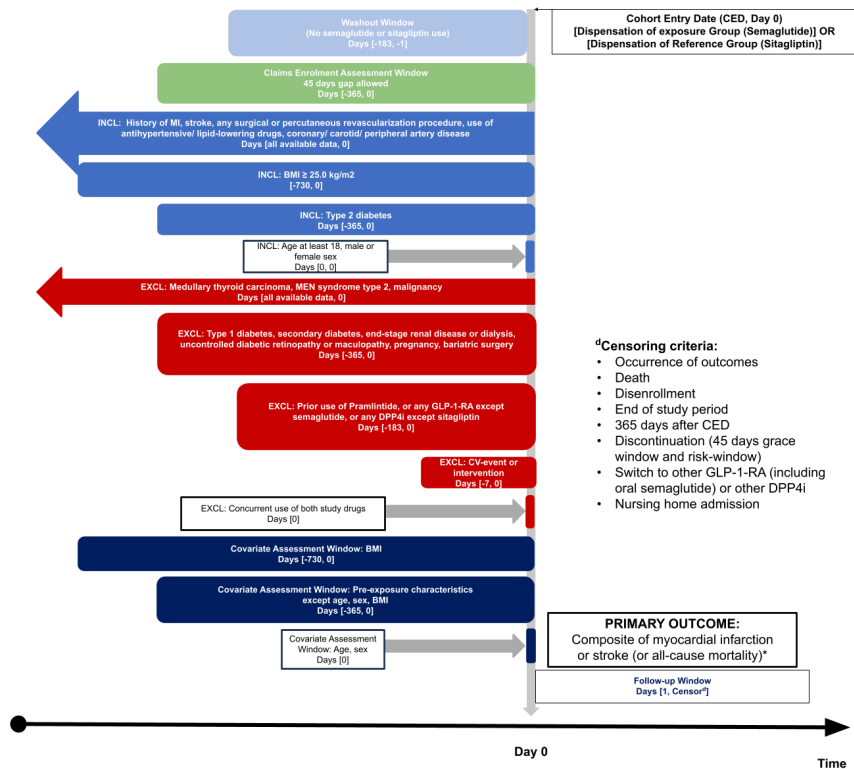

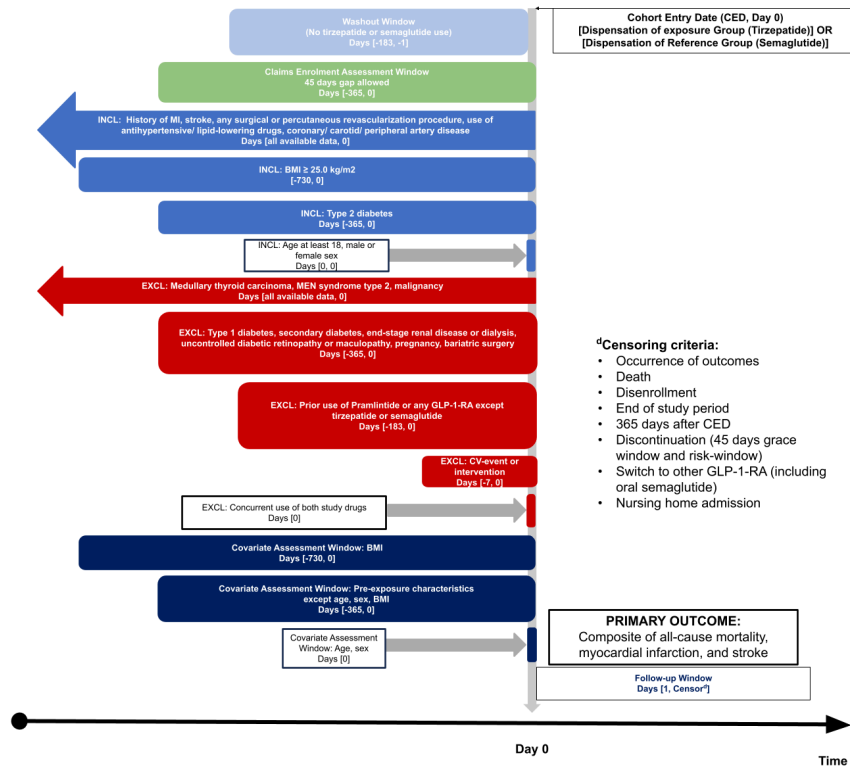

Figure 2. Study diagram for the comparison semaglutide vs sitagliptin.

\*Results including mortality will be viewed with scepticism in light of a benchmarking database study designed to emulate the SUSTAIN-6 trial that yielded divergent results for the mortality outcome. We therefore also assess the composite outcomes that exclude death as a component.

Figure 3. Study diagram for the comparison tirzepatide vs semaglutide.

- \*Censoring criteria:**
- Occurrence of outcomes
  - Death
  - Disenrollment
  - End of study period
  - 365 days after CED
  - Discontinuation (45 days grace window and risk-window)
  - Switch to other GLP-1-RA (including oral semaglutide)
  - Nursing home admission

## 6.3 Setting

### 6.3.1 Context and rationale for definition of time 0 (and other primary time anchors) for entry to the study population

Time 0 in the database studies was defined to emulate randomization to tirzepatide vs dulaglutide/ semaglutide vs sitagliptin/ tirzepatide vs semaglutide in the trial design. See appendix tables 1<sup>tirzdula, semasita, tirzsema</sup> and 2a<sup>tirzdula, semasita, tirzsema</sup> for operational definitions and detailed code algorithms.

### 6.3.2 Context and rationale for study inclusion criteria:

Study inclusion criteria were defined to reflect clinical routine care settings. See appendix tables 1<sup>tirzdula, semasita, tirzsema</sup> and 2<sup>tirzdula, semasita, tirzsema</sup> for operational definitions and detailed code algorithms. A flowchart of the study cohort assembly is provided in appendices 3<sup>tirzdula, semasita, tirzsema</sup>.

### 6.3.3 Context and rationale for study exclusion criteria

Study exclusion criteria were defined to reflect clinical routine care settings. See appendix tables 1<sup>tirzdula, semasita, tirzsema</sup> and 2<sup>tirzdula, semasita, tirzsema</sup> for operational definitions and detailed code algorithms. A flowchart of the study cohort assembly is provided in appendices 3<sup>tirzdula, semasita, tirzsema</sup>.

## 6.4 Variables

### 6.4.1 Context and rationale for exposure(s) of interest

The exposure and comparator were defined to emulate the agents compared for the trial, tirzepatide vs semaglutide (active-comparator). See appendix tables 1<sup>tirzdula, semasita, tirzsema</sup> and 2<sup>tirzdula, semasita, tirzsema</sup> for operational definitions and detailed code algorithms.

#### Algorithm to define duration of exposure effect:

Assuming the effect of the drug lasts for 45 days after the last day's supply, we allow a 45 days gap between the dispensation (grace period) and also add 45 days at the end of the last day's supply (exposure risk window).

### 6.4.2 Context and rationale for outcome(s) of interest

The primary outcome for the database study was defined as MACE (composite of all-cause mortality, myocardial infarction, or stroke). The results for all-cause mortality or composite outcomes that include death will be viewed with scepticism for the comparison of injectable semaglutide vs sitagliptin because a benchmarking database study designed to emulate the SUSTAIN-6 trial using Optum and MarketScan data yielded divergent results for the mortality outcome. See appendix tables 1<sup>tirzdula, semasita, tirzsema</sup> and 2<sup>tirzdula, semasita, tirzsema</sup> for operational definitions and detailed code algorithms. Optum includes death information from the inpatient discharged dead status, social security death master file, and deaths scraped from obituaries or other sources. MarketScan includes information from the inpatient discharged dead status as well as social security death master file. PPV for myocardial infarction using ICD9 codes was 94%.<sup>19-21</sup> PPV for ischemic stroke using ICD9 codes was 95%. Both of the above ICD9 codes were mapped to ICD10, but no validation study was performed.<sup>22</sup>

Secondary outcomes from the trial that will be evaluated include:

1. Individual components of the primary endpoint, i.e., all-cause mortality, myocardial infarction, or stroke.

- 2. Composite of all-cause mortality, hospitalization for heart failure, or urgent heart failure visits requiring intravenous diuretics.
- 3. For semaglutide vs sitagliptin only:
  - a. A composite outcome of myocardial infarction or stroke.
  - b. A composite of hospitalization for heart failure, or urgent heart failure visits requiring intravenous diuretics.

Safety outcomes of interest include:

- 1. Urinary tract infections.
- 2. Serious bacterial infections.
- 3. Gastrointestinal adverse events.

Control outcomes of interest include:

- 1. Hernia (excluding patients with recent outcome prior to the follow-up time window). This is a negative control outcome where no difference in effect is expected for the three comparative studies.
- 2. Lumbar radiculopathy (excluding patients with recent outcome prior to the follow-up time window). This is a negative control outcome where no difference in effect is expected for the three comparative studies.

### 6.4.3 Context and rationale for follow-up

Both on-treatment (OT) and intention-to-treat (ITT) analyses will be conducted. Adherence in clinical practice databases is expected to be much worse than in the trial, therefore the OT analysis will be the primary analysis. The OT analysis targets the relative hazard of outcomes while on treatment and may more closely emulate the effect observed in highly adherent trial participants. Both OT and ITT analyses will be conducted with up to 1-year follow-up.

<sup>1</sup> follow-up ends at the first occurrence of any of the selected criteria that end follow-up.

#### 6.4.4 Context and rationale for covariates (confounding variables and effect modifiers, e.g. risk factors, comorbidities, comedications)

We identified a series of covariates that were likely confounders due to being strong risk factors for the primary outcome that were associated with choice of treatment. These include demographics, disease severity related variables, comorbid conditions, comedications, frailty, healthcare utilization and markers of health seeking behaviour.

## 6.5 Data analysis

### 6.5.1 Context and rationale for analysis plan

The studies will use a propensity score (PS) 1:1 nearest neighbor matching with a caliper of 0.01 on the propensity score scale. The propensity score will be estimated as the probability of initiating tirzepatide vs dulaglutide, semaglutide vs sitagliptin, or tirzepatide vs semaglutide given the baseline patient characteristics using multivariable logistic regression models. As diagnostics for PS models, the study will evaluate distributional covariate balance using standardized differences and c-statistics post-matching. The study will estimate the hazard ratio for injectable tirzepatide vs dulaglutide, semaglutide vs sitagliptin, and tirzepatide vs semaglutide on MACE outcome in the matched population using a Cox proportional hazards model.

**Table 3. Primary, secondary, and subgroup analysis specification**

#### Primary analysis: Tirzepatide vs dulaglutide

<b>Hypothesis:</b>	Tirzepatide vs dulaglutide does not increase the risk of a composite of death, myocardial infarction, or stroke in patients typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with type 2 diabetes and overweight.
<b>Exposure contrast:</b>	Tirzepatide vs dulaglutide.
<b>Outcome:</b>	Composite of all-cause mortality, myocardial infarction, or stroke.
<b>Analytic software:</b>	Aetion, SAS 9.4, R.4.4.0, Python 3.13.3
<b>Model(s): (provide details or code)</b>	Outcome model: Cox proportional hazards Follow-up time * status(0) = exposure
<b>Confounding adjustment method</b>	<b>Name method and provide relevant details, e.g. bivariate, multivariable, propensity score weighting (specify weighting algorithm ratio and caliper), propensity score weighting (specify weight formula, trimming, truncation), propensity score stratification (specify strata definition), other.</b>
	1:1 Propensity score nearest-neighbor matching with a caliper of 0.01 on the propensity score scale.
<b>Missing data methods</b>	<b>Name method and provide relevant details, e.g. missing indicators, complete case, last value carried forward, multiple imputation (specify model/variables), other.</b>
	Assumption that if no relevant claims diagnoses/procedures are present, the condition is not present.
<b>Subgroup Analyses</b>	<b>List all subgroups</b>
	Age <65, Age ≥65, Male, Female, with concomitant SGLT2 inhibitor, without concomitant SGLT2 inhibitor, individuals at high cardiovascular risk (defined as history of cardiovascular event, coronary/carotid/peripheral artery revascularization procedure), Coronary heart disease, Cardiomyopathy, Valve disorders, Heart failure, Concomitant high-intensity lipid-lowering therapy.

#### A. Co-primary analysis: Injectable semaglutide vs sitagliptin

<b>Hypothesis:</b>	Injectable semaglutide decreases the risk of a composite of all-cause mortality, myocardial infarction, or stroke in patients typically treated in clinical practice who are at low, moderate, and high cardiovascular risk with type 2 diabetes and overweight. Results from this analysis will be viewed with scepticism in light of a benchmarking database study designed to emulate the SUSTAIN-6 trial that yielded divergent results for the mortality outcome.
<b>Exposure contrast:</b>	Injectable semaglutide vs sitagliptin.

Negative control outcomes, including hernia and lumbar radiculopathy	We evaluate negative control outcomes of hernia and lumbar radiculopathy, where no causal effect is expected from tirzepatide, dulaglutide, semaglutide, or sitagliptin.	We will evaluate the potential impact of residual confounding on this outcome for which there is not expected to be a causal effect	The evaluates the robustness of the interpretation of the primary analysis by evaluating the potential magnitude of unmeasured confounding	This analysis assumes that the confounding structure is the same or similar for the negative control outcome as the outcome of interest
Effect estimation in individuals with HbA1c measurement.	The population will be restricted to individuals with a HbA1c measurement in the 120 days before cohort entry.	To assess the impact of restricting to individuals with HbA1c measurement and including HbA1c in the PS model.	Includes baseline glycemic information as captured in laboratory HbA1c measurements.	This approach highly restricts the number of eligible individuals under study and thereby the statistical power of the analysis.

informative censoring.		“intention-to-treat” approach.		treatment effect had patients remained on therapy.
2-year on-treatment analysis (post-hoc)	We will follow the patients for up to 2 years on-treatment.	To examine potential changes in the comparative effectiveness beyond the 1-year on-treatment analysis.	Examines potential changes of effectiveness beyond the 1-year follow-up in the primary analysis.	Very few patients in clinical practice remain on treatment beyond one year. Consequently, the small number of individuals still at risk during extended follow-up represents a selected subset of patients, which may introduce bias. Moreover, the sparse data in this later period mean that outcomes among a few remaining participants can have a disproportionate effect on the Kaplan–Meier estimates.

## 6.6 Data sources

### 6.6.1 Context and rationale for data sources

**Reason for selection:** The studies will be conducted in 3 US health care claims databases: Optum Clinformatics (2018-2025), Merative MarketScan (2018-2023), and Medicare (2018-2020). Data from the Merative MarketScan database will only be included if sufficient sample size can be accrued.

**Strengths of data source(s):** Each data source contains deidentified, longitudinal, date-stamped information on patient enrollment, demographics, inpatient/outpatient diagnosis and procedures, admission and discharge dates, and medication dispensation. The death data is captured in the Optum database from inpatient discharge status, social security death master file, and deaths scraped from obituaries or other sources. The death data in MarketScan is captured from the social security death master file and inpatient discharge status. It is recognized that the social security death master file has high specificity and positive predictive value for deaths. While this data resource has under captured deaths since 2011, the capture of deaths is not expected to be differential between compared exposure groups. The death data is captured in the Medicare database from inpatient discharge status, and social security death master file.<sup>26–28</sup>

**Limitations of data source(s):** Patient healthcare encounters are only observable when they are enrolled in an insurance plan that contributes to the database. Patients may change insurance plans for multiple reasons. Both Optum Clinformatics and Merative MarketScan are primarily employer based insurance databases where patients may disenroll with job changes. In claims data, dispensing data for inpatient medication is unavailable. Diagnoses reflect billing practices, therefore algorithms (preferably validated) are needed for accurate phenotyping of patient conditions. Services that are not covered by insurance do not appear in the data. The trial evaluated cardiovascular deaths, however we will evaluate all-cause mortality in the emulation

because most deaths in this cohort of patients at high cardiovascular risk will be related to cardiovascular reasons, the cause of death is not recorded for databases not linked to NDI, and the performance of NDI at identifying cardiovascular causes of death may be suboptimal.<sup>28</sup>

## 6.7 Data management

Tracking data: The Data Use Agreement (DUA) Custodian (Principal Investigator) and the Division Operations Manager (Winta Tekle) are responsible for receiving and creating a record of new data associated with the given request. The Operations Manager is responsible for all indexing and archiving of documents and electronic media related to data that the Division receives and will log data location, data contents, and associated DUA and Institutional Review Board (IRB) numbers in the Division's centralized tracking system.

Handling and storage: In-scope data will be stored utilizing Mass General Brigham approved information systems – i.e., Division servers and Mass General Brigham network storage.

Archiving: Data retention and any removal will be executed by the Division Operations Manager (Winta Tekle) and Data Manager (Todd MacGarvey). The Division follows Mass General Brigham enterprise record retention policies and follow the terms of the agreement through which the in-scope data was received.

Information security: The Division follows Mass General Brigham's Enterprise Information Security Program (EISP). The EISP helps by providing assurance that Mass General Brigham information and information systems are protected from unauthorized access, use, disclosure, duplication, modification, or destruction in order to maintain their confidentiality, integrity, and availability. To that end, the EISP policies, standards and procedures create an information security framework that is aligned with the recommendations of the International Organization for Standardization's (ISO) publication 27001 and the National Institute of Standards and Technology's (NIST) publication 800-53 Family of Controls and MGB regulatory and legal requirements (as a HIPAA covered entity).

Mass General Brigham workforce members are required to complete new workforce privacy and information security training upon hire and annually thereafter. Refresh training is provided as appropriate. Mass General Brigham workforce members are required to review and sign a Confidentiality Agreement upon hire and annually thereafter. Additionally, we follow Enterprise Information Security and Privacy policies, including Managing Workforce Members Information Security Responsibilities Policy, which was developed to help assure that Mass General Brigham workforce members are competent and eligible to support the information security responsibilities associated with their role. Mass General Brigham workforce, including Division staff, are required to comply with Enterprise Information Security and Privacy Policies.

Facilities: The research team uses a highly secure, state-of-the-art, computing facility housed at Mass General Brigham's Corporate Data Centers in Needham and Marlborough, Massachusetts as well as Amazon Web Services (AWS). We maintain redundant storage for maximal data integrity and high-speed data access.

The Division uses Mass General Brigham corporate provisioned servers to analyze and store data in connection with this project. There are strict access controls enforced by technical means to ensure that only study staff who have been approved to conduct data analyses and contracted data engineers are able to access data (e.g., Mass General Brigham Authentication (Active Directory) utilized; auditing, logging, and monitoring enabled; firewalls enabled; etc.). All Division servers used in this study are accessible to only authorized staff only through the MGB network and utilizing VPN as appropriate (i.e., users must be on the network and logged into VPN to access). Mass General Brigham has a network information security monitoring team and in-scope servers are enrolled in enterprise security tools (e.g., vulnerability scanning service, antivirus, etc.).

The Division also uses AWS. In-scope AWS services / resources have undergone review and assessment by Mass General Brigham's Information Security Risk Assessment Team/ InfoSec Risk Management Team as required and in alignment with NIST 800-30: Guide for Conducting Risk Assessments. In-scope AWS servers are for our exclusive use (reserved instances), are covered under our organization's Business Associate Agreement with AWS. In-scope servers are housed in anonymous facilities that are not branded as AWS facilities. Physical access is strictly controlled both at the perimeter and at building ingress points by professional security staff utilizing video surveillance, intrusion detection systems, and other electronic means.

Security attributes and controls for the Division's use of in-scope AWS in connection with this project include: encryption at rest and in transit (industry standard AES-256 encryption, SSL/TSL), anti-malware, latest OS updates and patches as well as anti-virus; multi-factor authentication (MFA), Identity and Access Management, including SSO; auditing and logging; principle of least privilege, including for traffic and ports (e.g., deny all default configurations), use of VPC enabled Step functions, etc.; separation between environments; minimum necessary (out of the box AWS roles are not used as they can be overly permissive); all data would reside in the US domestic regions – use only US east HIPAA compliant region; performance monitoring enabled and reviewed as per internal processes; passwords compliant with enterprise password policy and, as appropriate, more protective password requirements; etc. Our Division's AWS use is also subject to ongoing evaluation and monitoring as well – e.g., vulnerability scanning and management, access review, etc.

A data file list will be maintained in Amazon S3 and tracked through Cloudtrail and Cloudwatch. Reporting of data file availability for any file stored in an S3 bucket will be controlled by MGB.

Amazon EC2, Amazon EBS, and Amazon VPC are integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in Amazon EC2, Amazon EBS, and Amazon VPC. CloudTrail captures all API calls for Amazon EC2, Amazon EBS, and Amazon VPC as events, including calls from the console and from code calls to the APIs. MGB IT/security staff have full access to CloudTrail to ensure that CloudTrail monitoring is available at all times. Amazon CloudWatch Events delivers a near-real-time stream of system events that describe changes in AWS resources. Amazon CloudTrail can log, continuously monitor, and retain account activity related to actions across the MGB AWS infrastructure. CloudTrail provides event history of MGB AWS account activity. This event history simplifies security analysis, resource change tracking, and troubleshooting and complies with requirements to ensure the data file inventory is controlled by MGB.

Backups: Backups are created using industry recognized Cryptographic mechanisms (e.g., 256-bit AES encryption) as appropriate and required. Data are backed up within the MGB network from the MGB Needham data center to the MGB Marlborough data center via replication/mirroring and volume-level snapshots. AWS Backup supports both instance-level backups as Amazon Machine Images (AMIs) and volume-level backups as separate snapshots based on the resource tags. AMIs allow MGB IT and security staff to create backups of all S3 and EC2 instances.

In addition to the safeguards listed above, the Division follows enterprise privacy and information security policies and maintains internally procedures in connection with this project to safeguard the data in connection with this project as appropriate and required including: Physical Security and Environmental Controls for Electronic Information Policy; IT Access Control Standards for Users policy; Safeguarding Fax Copiers Printers Telephone Use and Pagers; Physical Removal and Transport of Protected Health Information and Personal Information policy, etc.

## 6.8 Quality control

Senior Programmers and Research Specialists perform QA/QC on raw or common data model converted data via SAS/R/Aetion software. The protocol will be iteratively developed and pre-specified data checks including feasibility counts and balance on baseline covariates will be conducted with outputs reviewed by MGB team members. Team members will review code lists to ensure fidelity to intended algorithms.

## 6.9 Study size and feasibility

See appendices 4<sup>tirzdula, semasita, tirzsema</sup> and appendices 5<sup>tirzdula, semasita, tirzsema</sup> (feasibility, weighting on age, sex, comorbidity score as well as all predefined propensity score variables). Propensity score distribution plots with c-statistics are available in appendices 6<sup>tirzdula, semasita, tirzsema</sup>. Tables 1<sup>tirzdula, semasita, tirzsema</sup> showing prevalence of baseline characteristics and standardized differences in distribution are available in appendices 7<sup>tirzdula, semasita, tirzsema</sup>. Additional diagnostic evaluations, including balance assessments of laboratory and clinical examination test results not included in the propensity score will be conducted to assess potential residual confounding and divergence of treatment over time.

## 7. Limitation of the methods

As we are using secondary data and the data were not collected for research purposes, some important variables may not be collected or will be measured imperfectly. We have selected validated algorithms when possible and we have created proxies for important variables that are not directly captured in the data to reduce confounding by unmeasured factors.

Although we plan to emulate the important features of each trial as closely as possible in healthcare claims, there may be some elements of the RCT design that are not emulable with a database study, which means that the real-world evidence obtained from the database study and trial will address slightly different clinical questions. For example, in routine clinical care, adherence to treatment is typically not as high as it is in an RCT with strong measures in place to encourage adherence to the study protocol. This means that there is more discontinuation and short-term medication use in the patients identified in claims databases than trial participants.

Apparent agreement between RCT and database study results could occur if the effects of multiple factors (chance, emulation differences, bias) cancel each other out.

## 8. Protection of human subjects

This study has been approved by the Brigham and Women's Hospital Institutional Review Board.

Algorithm detail: Adherence in clinical practice databases is expected to be much worse than in the trial, therefore the on-treatment analysis at 1 year follow-up will be the primary analysis.

Algorithm detail: If BMI measurement via LOINC code is below 10 or above 100 then measurent is set to missing.

In order to complete the initial power analysis, a dummy outcome of a 90-day gap in database enrollment was used. This outcome is used to ensure that no information on the comparative risks of the outcomes of interest are available at this stage. We completed a PS overlap weighted comparative analysis using this outcome. The PS included only 3 covariates: age, sex, and combined comorbidity index. Power calculations are based on the formulas from Chow et al. (2008).

	Moderate proxy definition
	Poorly measured in database
	Poorly measured in database and not important
Algorithm detail: Adherence in clinical practice databases is expected to be much worse than in the trial, therefore the on-treatment analysis at 1 year follow-up will be the primary analysis.	

Algorithm detail: If BMI measurement via LOINC code is below 10 or above 100 then measure is set to missing.
