

CLINICAL STUDY SUBPROTOCOL

Protocol Title:	A Phase 2, Open-Label, Multicenter, Basket Study Evaluating the Efficacy of Brexucabtagene Autoleucel in Adults with Rare B-cell Malignancies (ZUMA-25) – <i>Substudy B – Relapsed/Refractory Richter Transformation</i>
Note:	This subprotocol should be used in conjunction with the KT-US-568-0138 master protocol
Protocol Number:	KT-US-568-0138-B (ZUMA-25B)
Indication:	Relapsed/refractory Richter transformation
Kite Investigational Product:	Brexucabtagene autoleucel
Kite IND Number:	028542
EU CT Number:	2022-501260-18-00
Clinical Trials.gov Identifier:	NCT05537766
Sponsor:	Kite Pharma, Inc. 2400 Broadway Santa Monica, CA 90404 United States of America
Contact Information:	The medical monitor name and contact information is provided on the Key Study Team Contact List
Protocol Version/Date:	Original: 23 May 2022 Amendment 1.0: 20 July 2022 Amendment 1.1: 12 January 2023 Amendment 2.0: 01 March 2023 Amendment 3.0: 17 August 2023

This study will be conducted under United States (US) Food and Drug Administration (FDA) Investigational New Drug (IND) application regulations (21 Code of Federal Regulations Part 312); however, sites located in the European Economic Area, and Switzerland are not included under the IND application and are not considered to be IND application sites.

This study will be conducted in compliance with this protocol and in accordance with the ethical principles that have their origin in the Declaration of Helsinki, and that are consistent with International Council for Harmonisation (ICH) Good Clinical Practice (GCP) and applicable regulatory and local requirements.

PROTOCOL SYNOPSIS

Kite Pharma, Inc.
2400 Broadway
Santa Monica, CA 90404

Protocol Title: A Phase 2, Open-Label, Multicenter, Basket Study Evaluating the Efficacy of Brexucabtagene Autoleucel in Adults with Rare B-cell Malignancies (ZUMA-25) Substudy B – Relapsed/Refractory Richter Transformation	
Indication: Adult subjects with relapsed/refractory (r/r) Richter transformation (RT)	
Kite IND Number: 028542 EU CT Number: 2022-501260-18-00 Clinical Trials.gov Identifier: NCT05537766	
Kite Investigational Product: Brexucabtagene autoleucel	
Other Investigational Product/IND Number: Not applicable	
IDE Number: Not applicable	
Number of Study Sites Planned: Approximately 25	
Objectives and Endpoints: Objectives and endpoints that are common to all indications are detailed in the KT-US-568-0138 master protocol. Additional objectives and endpoints that are specific to this substudy are detailed below.	
Primary Objective	Primary Endpoint
<ul style="list-style-type: none"> To evaluate the efficacy of brexucabtagene autoleucel on diffuse large B-cell lymphoma (DLBCL)-RT in subjects with RT, by determining the objective response rate (ORR) by central assessment 	<ul style="list-style-type: none"> ORR, defined as the proportion of subjects who achieve a best response of either complete response (CR) or partial response (PR). Response will be determined by central assessment per the Lugano Classification {Cheson 2014}
Secondary Objectives	Secondary Endpoints
<ul style="list-style-type: none"> To evaluate the efficacy of brexucabtagene autoleucel on DLBCL-RT in subjects with RT, by determining the ORR by investigator assessment 	<ul style="list-style-type: none"> ORR, defined as the proportion of subjects who achieve a best response of either CR or PR. Response will be determined by investigator assessment per the Lugano Classification {Cheson 2014}
<ul style="list-style-type: none"> To evaluate the efficacy of brexucabtagene autoleucel on DLBCL-RT based on clonal relationship to the underlying chronic lymphocytic leukemia (CLL) by central assessment 	<ul style="list-style-type: none"> ORR, defined as the proportion of subjects who achieve a best response of either CR or PR by central assessment per the Lugano Classification {Cheson 2014}, in subgroups by clonal relationship to the underlying CLL. Clonality will be assessed by central assessment

<ul style="list-style-type: none"> To evaluate the efficacy of brexucabtagene autoleucl on the underlying CLL by investigator assessment 	<ul style="list-style-type: none"> ORR, defined as the proportion of subjects who achieve a best response of either CR, CR with incomplete marrow recovery (CRi), or PR per International Workshop on Chronic Lymphocytic Leukemia (IWCLL) 2018 criteria {Hallek 2018}
Exploratory Objectives	Exploratory Endpoints
<ul style="list-style-type: none"> To evaluate the CLL measurable residual disease (MRD) negative response rate in subjects who have achieved a CR 	<ul style="list-style-type: none"> Rate of MRD negative response among subjects who have achieved a CR. MRD will be done by local assessment
<ul style="list-style-type: none"> To evaluate the efficacy of brexucabtagene autoleucl on DLBCL-RT based on receipt of bridging therapy 	<ul style="list-style-type: none"> ORR, defined as the proportion of subjects who achieve a best response of either CR or PR, in subgroups by receipt of bridging therapy (yes/no)
<p>Study Design: This substudy protocol contains details regarding all elements of the study that are unique to subjects with RT. In contrast, the KT-US-568-0138 master protocol contains additional information that is common for all indications in this basket study. Both the KT-US-568-0138 master protocol and this substudy protocol should be referenced in parallel.</p> <p>This is a Phase 2, open-label, multicenter study evaluating the efficacy of brexucabtagene autoleucl in subjects with r/r RT.</p> <p>Initially, 1 subject will be enrolled and infused. No additional subjects will be enrolled until the subject has been monitored for at least 28 days post-infusion. Subsequently, an additional 2 subjects can be enrolled in parallel. After these initial 3 subjects have been evaluated for at least 28 days, the safety review team (SRT) will make recommendations on the further conduct of this substudy.</p> <p>Following enrollment, eligible subjects will be treated with cyclophosphamide and fludarabine lymphodepleting chemotherapy, followed by an initial dose of 2×10^6 anti-CD19 chimeric antigen receptor (CAR) T cells/kg body weight. Following review by the SRT, the dose may be lowered to 1×10^6 anti-CD19 CAR T cells/kg body weight.</p> <p>Disease response will be assessed at Day 28, Month 3, and then every 3 months up to Month 12, followed by every 6 months up to Month 24.</p> <p>Additional study details are provided in the KT-US-568-0138 master protocol.</p> <p>Subjects enrolled in this substudy may receive optional bridging therapy to stabilize disease as described in Section 7.2. If already receiving a Bruton's tyrosine kinase (BTK) inhibitor, subjects may receive ibrutinib through screening and leukapheresis at the discretion of the investigator, as described in Section 5.2 and Section 7.1.</p> <p>The study schema is detailed in Figure 1 of the KT-US-568-0138 master protocol.</p>	
<p>Number of Subjects Anticipated to be Enrolled and Treated: Approximately 60 subjects with r/r RT will be enrolled and treated in this substudy. Three to 6 additional subjects may be enrolled if the SRT recommends proceeding at the lower dose level.</p>	

Target Population: Male or female adults ≥ 18 years of age with CLL and r/r RT

Duration of Treatment and of Study Participation: The treatment period will be 1 week following infusion, and the duration of the study is 24 months.

Eligibility Criteria Unique to the RT Substudy:

In addition to the common eligibility criteria specified in the KT-US-568-0138 master protocol, all of the following additional substudy-specific eligibility criteria must also be met.

RT Substudy-specific Inclusion Criteria:

- 1) Confirmed diagnosis of CLL based on IWCLL 2018 criteria {[Hallek 2018](#)} (Section [12.3.2](#)), with histologically confirmed RT to a DLBCL subtype
- 2) Relapsed or refractory disease after any first-line chemoimmunotherapy, defined as at least 1 of the following:
 - a) Refractory disease, defined as progressive disease or stable disease as best response to first-line therapy
 - b) Relapsed disease, defined as complete remission to first-line therapy followed by biopsy-proven disease relapse. Subjects will be eligible regardless of the duration of remission prior to relapse.
- 3) At least 1 measurable lesion based on the Lugano Classification {[Cheson 2014](#)}. Lesions that have been previously irradiated will be considered measurable only if progression has been documented following completion of radiation therapy

RT Substudy-specific Exclusion Criteria:

- 1) Diagnosis of RT not of DLBCL subtype (including, but not limited to, Hodgkin lymphoma and prolymphocytic leukemia)
- 2) Prior allogeneic or autologous stem cell transplant < 3 months prior to screening and/or < 4 months prior to planned infusion of brexucabtagene autoleucel
- 3) Presence of active graft-versus-host disease following prior stem cell transplant

Study Procedures: Subjects will undergo procedures and assessments as detailed in the schedule of assessments (see Section [12.2](#)).

Investigational Product and Study Treatments, Dose, and Mode of Administration:

Treatment consists of a lymphodepleting chemotherapy regimen, followed by a single infusion of brexucabtagene autoleucel. Additional details are provided in the KT-US-568-0138 master protocol.

Safety Review Team and Data Safety Monitoring Board: An SRT, comprising the study sponsor and at least 1 study investigator, will be specifically chartered to review the safety data and make recommendations on further study conduct, progression, and/or dose modification after 3 or 6 subjects in this substudy have been treated with the initial dose (2×10^6 anti-CD19 CAR T cells/kg of body weight) and followed for 28 days, as detailed in the KT-US-568-0138 master protocol.

An independent Data Safety Monitoring Board (DSMB) will be chartered to review safety and efficacy data to make study conduct recommendations based on an analysis of risk versus benefit. The DSMB will review serious adverse event (SAE) information (listings or narratives) and suspected unexpected serious adverse reactions (SUSARs) on a regular basis throughout subject treatment in the study and per the DSMB charter or DSMB discretion. The DSMB may request additional safety or efficacy data or recommend modifying the study conduct. The sponsor may request additional reviews by the DSMB. Data submitted to the DSMB may or may not be source data verified to facilitate timely DSMB review.

SUSARs and SAE listings or narratives may be submitted to the DSMB chair as described in the DSMB charter.

Additional details regarding the SRT, DSMB, and dose-limiting toxicities are provided in the KT-US-568-0138 master protocol.

Statistical Methods:

Hypothesis: An alternative hypothesis is proposed with a target 50% ORR per central assessment against a null hypothesis that the ORR is $\leq 28\%$. The hypothesis is that the ORR to brexucabtagene autoleucel per central assessment is greater than 28%.

Sample Size Calculation: This single-arm, open-label substudy will enroll and treat 60 subjects with the SRT-recommended dose of brexucabtagene autoleucel. This sample size will achieve a statistical power of $\geq 90\%$ if there is at least a 22% improvement in ORR (brexucabtagene autoleucel: 50% versus historical control: 28%) with a type 1 error rate of 0.025 (1-sided).

Analyses: An interim analysis will be conducted after 20 subjects (33%) have had the opportunity to be evaluated for response 3 months after treatment with brexucabtagene autoleucel. In this interim analysis, the DSMB will review investigator-reported data for both safety and efficacy (futility only). The non-binding futility boundary is ORR of 30.4% based on the beta spending function of rho family (parameter = 0.6), with a crossing probability of 59% under the null hypothesis ($\text{ORR} \leq 28\%$). A decision will be made by the sponsor based on DSMB recommendation, with the complete benefit/risk profile of brexucabtagene autoleucel being taken into account. If the decision is made to discontinue the substudy, then this analysis will be considered the primary analysis of this substudy. Study enrollment will be paused following treatment of the 20th subject with brexucabtagene autoleucel and until data from the interim analyses have been assessed.

If the decision based on the interim analysis is to continue the substudy, a primary analysis will be conducted after 60 subjects have been enrolled and treated with the SRT-recommended dose of brexucabtagene autoleucel and the last subject has had the opportunity to be assessed for response at least 6 months after the brexucabtagene autoleucel infusion.

Hypothesis testing will be based on the number of objective responders observed among the 60 subjects, as described above. The point estimate of the ORR will be calculated, together with its 95% confidence interval using the Clopper-Pearson method. The p-value will be calculated based on exact test. If more than 60 subjects are treated with the SRT-recommended dose in this substudy by the time of data cutoff, all treated subjects will be included in the primary analysis.

A follow-up analysis may be performed after all treated subjects have had the opportunity to be assessed for response at least 18 months after the brexucabtagene autoleucel infusion to further evaluate the risk-benefit profile of brexucabtagene autoleucel, including the durability of response. This analysis will be descriptive.

Additional descriptive analyses may occur after the primary and follow-up analyses described above have been completed.

The final analysis will be performed after all subjects have completed the study, outstanding data queries have been resolved or adjudicated as unresolvable, and the data have been cleaned and finalized.

This study will be conducted in compliance with this protocol; the International Council for Harmonisation of Technical Requirements for Pharmaceuticals for Human Use guidelines of Good Clinical Practice, including archiving of essential documents; and all applicable regulatory and local requirements.

This study will be conducted under United States Code of Federal Regulations Title 21 Part 312 or equivalent.

LIST OF ABBREVIATIONS

ASCO	American Society of Clinical Oncology
BTK	Bruton's tyrosine kinase
CAR	chimeric antigen receptor
CLL	chronic lymphocytic leukemia

SUSAR	suspected unexpected serious adverse reaction

1. INTRODUCTION

Refer to the KT-US-568-0138 master protocol for information related to brexucabtagene autoleucel (KT-US-568-0138 master protocol – Section 1.1), previous clinical studies (KT-US-568-0138 master protocol – Section 1.2.2), and the study rationale (KT-US-568-0138 master protocol – Section 1.4).

1.1. Disease Background

1.1.1. Epidemiology

Richter transformation (RT) is the occurrence of an aggressive lymphoma in patients with a previous or concomitant diagnosis of chronic lymphocytic leukemia (CLL), most commonly diffuse large B-cell lymphoma (DLBCL), accounting for 90% of cases, or Hodgkin lymphoma (HL), accounting for approximately 10% or less of cases {[Bockorny 2012](#)}. DLBCL-RT is rare, difficult to treat, and distinct from de novo DLBCL in its pathogenesis {[Rossi 2008](#)}. RT is reported in approximately 2% to 10% of CLL patients {[Molica 2010](#), [Petrackova 2021](#)}. In the United States, approximately 500 patients are diagnosed with RT each year.

Disease outcomes are distinct for patients for whom RT is clonally related to the underlying CLL (approximately 70%) and those for whom the disease is clonally unrelated (approximately 30%). Clonally-related RT has a more aggressive course and higher rates of treatment resistance and *TP53* aberrations compared with clonally-unrelated disease {[Petrackova 2021](#), [Rossi 2016](#)}. While median overall survival (OS) for patients with nonclonal RT is approximately 62 months, it is relatively poor for patients with clonal RT, with a reported median OS of approximately 10 months {[Parikh 2014](#), [Rossi 2011](#)}.

1.1.2. Diagnosis

Clinically, patients with RT present with an aggressive disease course characterized by rapidly enlarging lymph nodes, constitutional symptoms including fevers, night sweats, and unintentional weight loss, hepatosplenomegaly, frequent extranodal tissue involvement, and sudden elevations in serum lactate dehydrogenase {[Parikh 2014](#)}. Specific risk factors for the development of RT in a patient with CLL have yet to be identified; however, *TP53* disruption, *c-MYC* abnormalities, unmutated immunoglobulin heavy chain (IGHV) (sequence deviating $\leq 2\%$ relative to germline reference), non-del13q cytogenetics, *CD38* gene polymorphisms, stereotypy, and *VH4-39* gene usage may be predisposing factors. Studies also indicate that patients with CLL who harbor *NOTCH1* mutations have a significantly higher probability of developing RT compared with those without this defect {[Rossi 2012](#), [Rossi 2018](#)}.

1.1.3. Current Treatment Approaches

Various chemotherapy and chemo-immunotherapy regimens have been tested for DLBCL-RT, including OFAR-1, OFAR-2, R-CHOP, O-CHOP, R-Hyper-CVAD, R-EPOCH, DHAP/ESHAP, Hyper-CVXD, and R-Hyper-CVXD. Most frequently used are R-CHOP or R-CHOP-like regimens (ie, R-EPOCH) because they provide a good balance between efficacy and toxicity compared with the other regimens. Using such regimens, objective response rates (ORRs) have increased beyond 50%, but with limited complete responses (CRs) and mean OS remaining below 1 year {[Rossi 2018](#)}. To further improve outcomes, both autologous and allogeneic stem cell transplant have been proposed as consolidation therapy in DLBCL-RT. However, most patients (85% to 90%) with DLBCL-RT are unfit or do not achieve adequate response to proceed to transplant {[Rossi 2018](#)}. Many patients will accordingly need second-line therapy following relapse or refractoriness to frontline chemotherapy. In the relapsed/refractory (r/r) setting, no consensus on treatment exists, and CR rates are reported to be between 0% and 33% using venetoclax, pembrolizumab, or chemotherapy {[Abrisqueta 2020](#), [Davids 2017](#), [Ding 2017](#), [Faderl 2003](#), [Thompson M C 2021](#), [Visentin A 2017](#)}.

The poor prognosis for patients with r/r DLBCL-RT has resulted in the use of various novel approaches including chimeric antigen receptor (CAR) T-cell therapies. In a retrospective analysis of 9 patients treated with axicabtagene ciloleucel, including 5 cases that were confirmed to be clonally related with high-risk features, the 8 evaluable patients (1 patient died before being evaluated for response) achieved an objective response, including 5 patients with CR and 3 patients with partial response (PR) {[Kittai 2020](#)}. In a similar study, 8 subjects, of whom 6 subjects had confirmed DLBCL-RT, were treated with CAR T-cell therapy. All subjects had received treatment post-transformation (eg, with R-CHOP, ibrutinib, and venetoclax) and had progressive disease before receiving a locally produced anti-CD19 CAR T-cell product. Five of 8 subjects achieved a CR after a median follow-up duration of 6 months (range: 4 to 10 months), and 2 subjects proceeded to allogeneic stem cell transplant {[Benjamini 2020](#)}.

Taken together, current therapies are limited for patients with r/r RT, and preliminary results indicate that CAR T-cell therapies may represent a viable therapeutic option for this difficult to treat patient population.

2. OBJECTIVES AND ENDPOINTS

Refer to Section 2 of the KT-US-568-0138 master protocol for a summary of common objectives and endpoints for this study.

Additional objectives and endpoints that are specific for this substudy are detailed in [Table 1](#).

Table 1. Substudy-specific Objectives and Endpoints

Primary Objective	Primary Endpoint
<ul style="list-style-type: none"> To evaluate the efficacy of brexucabtagene autoleucel on DLBCL-RT in subjects with RT, by determining the ORR by central assessment 	<ul style="list-style-type: none"> ORR, defined as the proportion of subjects who achieve a best response of either CR or PR. Response will be determined by central assessment per the Lugano Classification {Cheson 2014}
Secondary Objectives	Secondary Endpoints
<ul style="list-style-type: none"> To evaluate the efficacy of brexucabtagene autoleucel on DLBCL-RT in subjects with RT, by determining the ORR by investigator assessment 	<ul style="list-style-type: none"> ORR, defined as the proportion of subjects who achieve a best response of either CR or PR. Response will be determined by investigator assessment per the Lugano Classification {Cheson 2014}
<ul style="list-style-type: none"> To evaluate the efficacy of brexucabtagene autoleucel on DLBCL-RT based on clonal relationship to the underlying CLL by central assessment 	<ul style="list-style-type: none"> ORR, defined as the proportion of subjects who achieve a best response of either CR or PR by central assessment per the Lugano Classification {Cheson 2014}, in subgroups by clonal relationship to the underlying CLL. Clonality will be assessed by central assessment
<ul style="list-style-type: none"> To evaluate the efficacy of brexucabtagene autoleucel on the underlying CLL by investigator assessment 	<ul style="list-style-type: none"> ORR, defined as the proportion of subjects who achieve a best response of either CR, CRi, or PR per IWCLL 2018 criteria {Hallek 2018}
Exploratory Objectives	Exploratory Endpoints
<ul style="list-style-type: none"> To evaluate the CLL MRD negative response rate in subjects who have achieved a CR 	<ul style="list-style-type: none"> Rate of MRD negative response among subjects who have achieved a CR. MRD will be done by local assessment
<ul style="list-style-type: none"> To evaluate the efficacy of brexucabtagene autoleucel on DLBCL-RT based on receipt of bridging therapy 	<ul style="list-style-type: none"> ORR, defined as the proportion of subjects who achieve a best response of either CR or PR, in subgroups by receipt of bridging therapy (yes/no)

Abbreviations: CLL, chronic lymphocytic leukemia; CR, complete response; CRi, complete response with incomplete marrow recovery; DLBCL, diffuse large B-cell lymphoma; IWCLL, International Workshop on Chronic Lymphocytic Leukemia; MRD, measurable residual disease; ORR, objective response rate; PR, partial response; RT, Richter transformation.

3. STUDY DESIGN

3.1. Study Design

This substudy protocol contains details regarding all elements of the study that are unique to subjects with RT. In contrast, the KT-US-568-0138 master protocol contains additional information that is common for all indications in this basket study. Both the KT-US-568-0138 master protocol and this substudy protocol should be referenced in parallel.

This is a Phase 2, open-label, multicenter study evaluating the efficacy of brexucabtagene autoleucel in subjects with r/r RT.

Initially, 1 subject will be enrolled and infused. No additional subjects will be enrolled until the subject has been monitored for at least 28 days post-infusion. Subsequently, an additional 2 subjects can be enrolled in parallel. After these initial 3 subjects have been evaluated for at least 28 days, the safety review team (SRT) will make recommendations on the further conduct of this substudy.

Following enrollment, eligible subjects will be treated with cyclophosphamide and fludarabine lymphodepleting chemotherapy, followed by an initial dose of 2×10^6 anti-CD19 CAR T cells/kg body weight. Following review by the SRT, the dose may be lowered to 1×10^6 CAR T cells/kg body weight.

Disease response will be assessed at Day 28, Month 3, and then every 3 months up to Month 12, followed by every 6 months up to Month 24.

Additional details of the study design are provided in Section 3 of the KT-US-568-0138 master protocol.

Subjects enrolled in this substudy may receive optional bridging therapy to stabilize disease as described in Section 7.2. If already receiving a Bruton's tyrosine kinase (BTK) inhibitor, subjects may receive ibrutinib through screening and leukapheresis at the discretion of the investigator, as described in Section 5.2 and Section 7.1.

The study schema is detailed in Figure 1 of the KT-US-568-0138 master protocol.

An SRT, comprising the study sponsor and at least 1 study investigator, will be specifically chartered to review the safety data and make recommendations on further study conduct, progression, and/or dose modification. Additional details of the SRT are provided in Section 8.1.

An independent Data Safety Monitoring Board (DSMB) will be chartered to review safety and efficacy data to make study conduct recommendations based on an analysis of risk versus benefit. The DSMB will review investigator-reported safety and efficacy data against the futility rules after 20 subjects (33%) in this substudy have been treated with the SRT-recommended dose of brexucabtagene autoleucel and have had the opportunity to be followed for 3 months after the brexucabtagene autoleucel infusion. Study enrollment will be paused following treatment of the 20th subject with brexucabtagene autoleucel and until results from the interim analysis have been assessed. Additional details of the DSMB are provided in Section 8.1.

The end-of-study is defined in the Master protocol (refer to Section 3.4 of the Master protocol).

3.1.1. Rationale for Study Design Elements

3.1.1.1. Rationale for Bridging Therapy

Due to the aggressive nature of RT, bridging therapy may be administered at the discretion of the investigator, if deemed necessary for disease control between leukapheresis and availability of brexucabtagene autoleucel. Bridging therapy regimens and timing requirements are described in Section 7.2.

3.1.1.1.1. Rationale for Allowance of Ibrutinib Through Screening and Leukapheresis

If deemed necessary for disease control, and per investigator discretion, ibrutinib treatment will be a non-mandatory treatment option through screening and leukapheresis as described in Section 5.2 and Section 7.1. Previous data have shown that ibrutinib is not harmful for the leukapheresis product; however, these data are strongest for ibrutinib (and not acalabrutinib or zanubrutinib) possibly due to differences in the impact on T-cell function between these drugs {Davis J. E 2021}. Thus, ibrutinib only will be allowed through screening and leukapheresis.

4. SUBJECT POPULATION

4.1. Number of Subjects and Subject Selection

Approximately 60 subjects with r/r RT who have received 1 line of prior therapy will be enrolled and treated. Three to 6 additional subjects may be enrolled if the SRT recommends proceeding at the lower dose level (refer to Section 8.10.1 of the KT-US-568-0138 master protocol for additional details).

4.2. Eligibility Criteria

To be enrolled in the study, subjects must meet the common eligibility criteria detailed in Section 4.2 of the KT-US-568-0138 master protocol. In addition, subjects must also meet all of the additional substudy-specific eligibility criteria detailed in Section 4.2.1 and Section 4.2.2.

4.2.1. RT Substudy-specific Inclusion Criteria

- 1) Confirmed diagnosis of CLL based on International Workshop on Chronic Lymphocytic Leukemia (IWCLL) 2018 criteria {[Hallek 2018](#)} (Section 12.3.2), with histologically confirmed RT to a DLBCL subtype
- 2) Relapsed or refractory disease after any first-line chemoimmunotherapy, defined as at least 1 of the following:
 - a) Refractory disease, defined as progressive disease or stable disease as best response to first-line therapy
 - b) Relapsed disease, defined as complete remission to first-line therapy followed by biopsy-proven disease relapse. Subjects will be eligible regardless of the duration of remission prior to relapse.
- 3) At least 1 measurable lesion based on the Lugano Classification {[Cheson 2014](#)}. Lesions that have been previously irradiated will be considered measurable only if progression has been documented following completion of radiation therapy

4.2.2. RT Substudy-specific Exclusion Criteria

- 1) Diagnosis of RT not of DLBCL subtype (including, but not limited to, HL and prolymphocytic leukemia)
- 2) Prior allogeneic or autologous stem cell transplant < 3 months prior to screening and/or < 4 months prior to planned infusion of brexucabtagene autoleucel
- 3) Presence of active graft-versus-host disease following prior stem cell transplant

5. STUDY TREATMENT

5.1. Description of Study Treatment

Study treatment consists of lymphodepleting chemotherapy and a single infusion of brexucabtagene autoleucel, as described in Section 3.2 of the KT-US-568-0138 master protocol.

Subjects enrolled in this substudy may receive optional bridging therapy as described in Section 7.2. Permitted bridging therapy regimens are detailed in Table 2.

Prior and concomitant medications that are either unique to RT or that are managed differently for subjects with RT are described below. Refer to Section 5 of the KT-US-568-0138 master protocol for additional details regarding brexucabtagene autoleucel treatment, prior and concomitant medications, and excluded medications.

5.2. Prior and Concomitant Medications and Permitted Treatments

Subjects who were receiving ibrutinib prior to study entry, and for whom investigators deem it to be required, are permitted to continue this therapy through leukapheresis and up to 5 half-lives (30 hours) prior to the start of lymphodepletion, at the investigator's discretion. Subjects receiving another BTK inhibitor and who require continued BTK inhibitor treatment should switch to ibrutinib at the discretion of the investigator at the start of screening.

If subjects continue ibrutinib through the screening period and leukapheresis, a new baseline disease assessment must be performed at least 5 half-lives (30 hours) after cessation of ibrutinib treatment and before initiating lymphodepleting chemotherapy.

6. STUDY ASSESSMENTS UNIQUE TO RICHTER TRANSFORMATION

The study assessments that are either unique to RT or that are managed differently for subjects with RT are described here. Please refer to Section 6 of the KT-US-568-0138 master protocol for details of all other study assessments. Study assessments described in the KT-US-568-0138 master protocol and herein are to be performed according to the schedule of assessments (SOA) presented in Section 12.2 (Table 5 and Table 6) of this substudy protocol.

6.1. Medical and Treatment History

For subjects with RT, the medical and treatment history should also document the prior diagnosis, treatment, and response to treatment of the underlying CLL.

6.2. Brain Magnetic Resonance Imaging

If required, brain magnetic resonance imaging (MRI) will be performed with contrast whenever possible or without contrast in case of contraindication.

Screening:

- At screening, subjects with current symptoms or clinical signs of central nervous system (CNS) malignancy, such as severe headaches, neck stiffness, seizures, encephalopathy, cranial nerve deficits, or any focal neurological findings on physical examination, must undergo brain MRI to rule out current CNS metastasis, in which case such subjects are not eligible for the study.
- If required, the MRI should be performed as close to enrollment/leukapheresis as possible and within 28 days before leukapheresis for eligibility. An MRI collected as standard of care (SOC) within this timeframe is acceptable.
- After the initial screening and eligibility confirmation, if the subject presents with new-onset symptoms or clinical signs of CNS malignancy/disease, a repeat MRI is required to reassess eligibility prior to the start of lymphodepleting chemotherapy.
- CNS involvement will be assessed by local review, and images will not be sent for central review.

Post-infusion:

- Subjects with new-onset symptoms of CNS malignancy/disease, as described above, are recommended to have a brain MRI.
- In addition, in the case of cytokine release syndrome (CRS) and immune effector cell-associated neurotoxicity syndrome (ICANS), refer to the American Society of Clinical Oncology (ASCO) management guidelines for guidance of requirements for brain imaging

{[Santomasso 2021](#)}. In summary: i) brain MRI can be considered for all grades of CRS; ii) brain MRI or other neuroimaging can be considered for ICANS Grade 2 or higher, as supported by the ASCO management guidelines.

- A brain MRI only needs to be submitted to the independent central reviewer when there is evidence of disease progression.

6.3. Lumbar Puncture

Opening pressures should be measured with each lumbar puncture when possible and recorded in the subject's site chart.

Screening:

- Subjects with symptoms or clinical signs of CNS malignancy (eg, new-onset severe headaches, neck stiffness, or focal neurologic findings) or leptomeningeal carcinomatosis will have a lumbar puncture performed at screening for examination of cerebrospinal fluid (CSF) to determine the presence of CNS malignancy. There must be no evidence of CNS involvement to be eligible for this study.
- After the initial screening and eligibility confirmation, if the subject presents with new-onset symptoms or clinical signs of CNS malignancy/disease, a repeat lumbar puncture is required to reassess eligibility prior to the start of lymphodepleting chemotherapy.

Post-infusion:

- Subjects with symptoms or clinical signs of CNS malignancy, such as new-onset severe headaches, neck stiffness, seizures, encephalopathy, cranial nerve deficits, or any focal neurologic findings on physical examination, will have a lumbar puncture for examination of CSF (and brain MRI as described in Section 6.2).
- In the case of CRS and ICANS, refer to the ASCO management guidelines for guidance for requirements for lumbar puncture examination {[Santomasso 2021](#)}. In summary: i) lumbar puncture is recommended for consideration in cases of CRS; ii) for ICANS, a lumbar puncture is recommended for Grade 3 or higher neurotoxicity and may be considered for Grade 2.

CSF samples will be analyzed at the local laboratory. An aliquot will be sent to the central laboratory for assessment of analytes (including cytokines) and immune cell subsets.

6.4. Disease Assessments for DLBCL-RT and Underlying CLL

Disease response for DLBCL-RT will be assessed according to the Lugano Classification {[Cheson 2014](#)} (Section 12.3.1).

Assessment of the underlying CLL will be based on IWCLL 2018 criteria {[Hallek 2018](#)} (Section [12.3.2](#)).

Disease assessments will be performed according to the schedule presented in the SOA ([Table 5](#) and [Table 6](#)) and as described below. In addition, subjects with symptoms suggestive of disease progression should be evaluated for progression at the time symptoms occur, even if this requires an unscheduled visit.

6.4.1. Imaging Requirements

Positron emission tomography (PET)-diagnostic computed tomography (CT) scans are required in all subjects at screening, after bridging therapy (if applicable), and at the disease response assessment time points specified in the SOA ([Table 5](#) and [Table 6](#)).

For all PET-CT scans, the following requirements should be met:

- The CT must be of diagnostic quality with intravenous (IV)-iodinated contrast, performed by either of the following modalities, depending on the site's capability:
 - as part of a combined PET-diagnostic CT; or
 - as a separate diagnostic-quality CT (with IV-iodinated contrast)
- The PET-diagnostic CT scan must include the neck, chest, abdomen, and pelvis, along with appropriate imaging of all other sites of disease.
- If IV-iodinated contrast is contraindicated per the investigator, then the diagnostic CT scan can use non-iodinated contrast. If non-iodinated contrast is not available or not recommended by the investigator, then the diagnostic CT can be nonenhanced.
- In cases where CT with contrast is contraindicated, MRI of the abdomen and pelvis and CT of the chest without contrast is an acceptable alternative.
- All screening/baseline and disease assessment PET-diagnostic CT scans will be submitted to and reviewed by an independent central reviewer.
- Technical and shipping requirements for the PET-diagnostic CT scans will be outlined in the study imaging manual.
- On-study images will be performed with the same imaging modality and anatomical location as imaged at baseline.
- The PET portion of the PET-diagnostic CT scan will be scored per the Deauville 5-point scale. Both the PET and CT portions of the scan will be interpreted according to the Lugano Classification {[Cheson 2014](#)}. Refer to Section [12.3.1](#) for additional details.

Screening/Baseline:

- To confirm eligibility and/or to establish baseline (if bridging therapy is administered), PET-diagnostic CT scans are required at screening.
- PET-diagnostic CT scans should be performed as close to enrollment/leukapheresis as possible and within 28 days before leukapheresis for eligibility (unless imaging is available from SOC assessment within 28 days before enrollment), with the following clarifications:
 - A PET-diagnostic CT scan performed at the study site after the subject's last line of therapy and before signing of the informed consent form may be used for confirmation of eligibility, if relevant requirements described above are fulfilled and if it was performed within 28 days before enrollment/leukapheresis and no other anticancer treatment has been administered. (For subjects who are referred, a screening image is required.)
 - If a PET-diagnostic CT scan is performed > 28 days before the initiation of lymphodepleting chemotherapy or if the subject receives any anticancer therapy (bridging therapy) between the last PET-diagnostic CT scan and initiation of lymphodepleting chemotherapy, the PET-diagnostic CT scan must be repeated before lymphodepleting chemotherapy to establish a new baseline.

Disease Assessment:

- The PET-diagnostic CT scans will be performed at the time points outlined in the SOA (Table 5 and Table 6) through Month 24 or until disease progression, whichever comes first.
- A PET-diagnostic CT scan can be performed at any time disease progression is suspected.
- To limit radiation exposure, investigators are encouraged to leave at least 4 weeks between consecutive scans.

6.4.2. Bone Marrow Aspirate/Biopsy

Bone marrow aspirate and biopsy samples are required in all subjects and will be analyzed by the investigator at the local laboratory.

For the DLBCL-RT, the assessment of bone marrow will be in accordance with the Lugano Classification and will only be evaluated if the DLBCL-RT is not fluorodeoxyglucose (FDG)-avid (Figure 1).

For the underlying CLL, the bone marrow assessment will be performed in accordance with the IWCLL 2018 disease response criteria (Section 12.3.2).

The following requirements for the bone marrow assessment must be met:

- Local SOC assessment methods should be performed (immunohistochemistry, flow cytometry, or other). These will be reported in the electronic case report form (eCRF).
- For the underlying CLL, attempts should be made to characterize the presence of and percentage of CLL lymphocytes or presence of clonal B-lymphoid nodules per the IWCLL 2018 criteria (Section 12.3.2).
- For CLL, the data to be reported in the eCRF are based upon the IWCLL 2018 criteria and morphological status of the bone marrow (ie, normocellular for age, no or increase in CLL lymphocytes, no or presence of clonal B-lymphoid nodules, increase in CLL cells by $\geq 50\%$ on successive biopsies).
- For DLBCL-RT, the data to be reported in the eCRF will be per the Lugano Classification (ie, bone marrow involvement assessed via PET-CT or via bone marrow aspirate and biopsy in the absence of PET-CT imaging).
- For bone marrows assessed per the Lugano Classification, if applicable, data extracted from the eCRF will be provided to the vendor performing the independent central assessment of the primary endpoint.

Screening/Baseline (for both CLL and DLBCL-RT disease status assessments):

- Bone marrow aspirate and biopsy samples are required in all subjects at screening and after bridging therapy (if applicable), in order to assess the underlying CLL and to assess DLBCL-RT in case of a negative screening PET-CT (non-FDG-avid tumor) (Figure 1).
- At screening, bone marrow samples are also required to be sent to the central laboratory for retrospective central confirmation of disease diagnosis (refer to the central laboratory manual for details).

Disease/Response Assessment:

For the CLL disease response assessment:

- A bone marrow aspirate and biopsy are required at Day 28 and Month 3 for the underlying CLL response assessment. Beyond Month 3 and through Month 24, further bone marrow assessment is only required at Month 12 and Month 24, only in those subjects who responded (CR, CR with incomplete marrow recovery [CRi], or PR) at Month 3, in order to confirm CR per IWCLL 2018 criteria (Figure 1).
- To confirm a CR, the bone marrow aspirate and biopsy must show no evidence of disease by morphology or, if indeterminate by morphology, must be negative by immunohistochemistry.

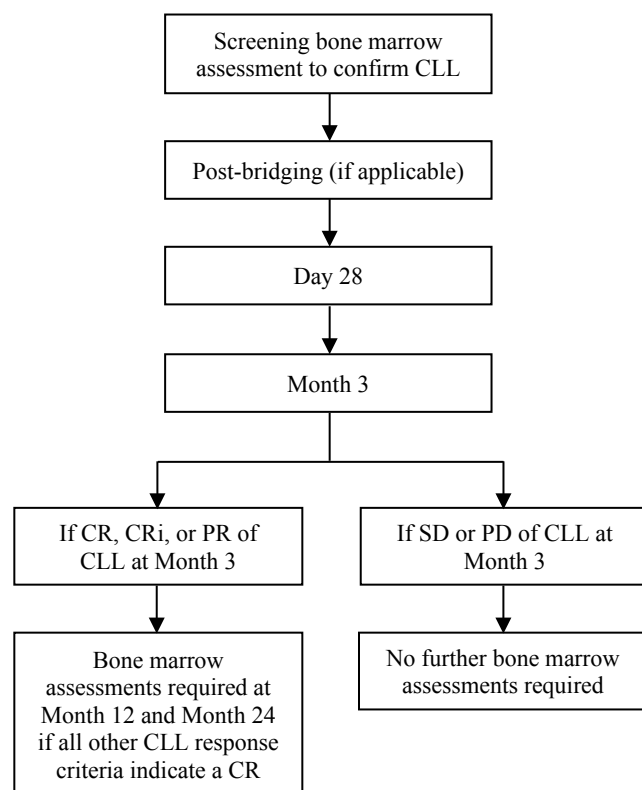

- In subjects who experience disease progression or who achieve a CR of CLL but subsequently relapse, if a bone marrow aspirate (that is clinically indicated in the management of a study treated subject) is acquired, a portion of the aspirate should be sent to the central laboratory if feasible for additional exploratory analyses (refer to the central laboratory manual for details).

For the DLBCL-RT disease response assessment:

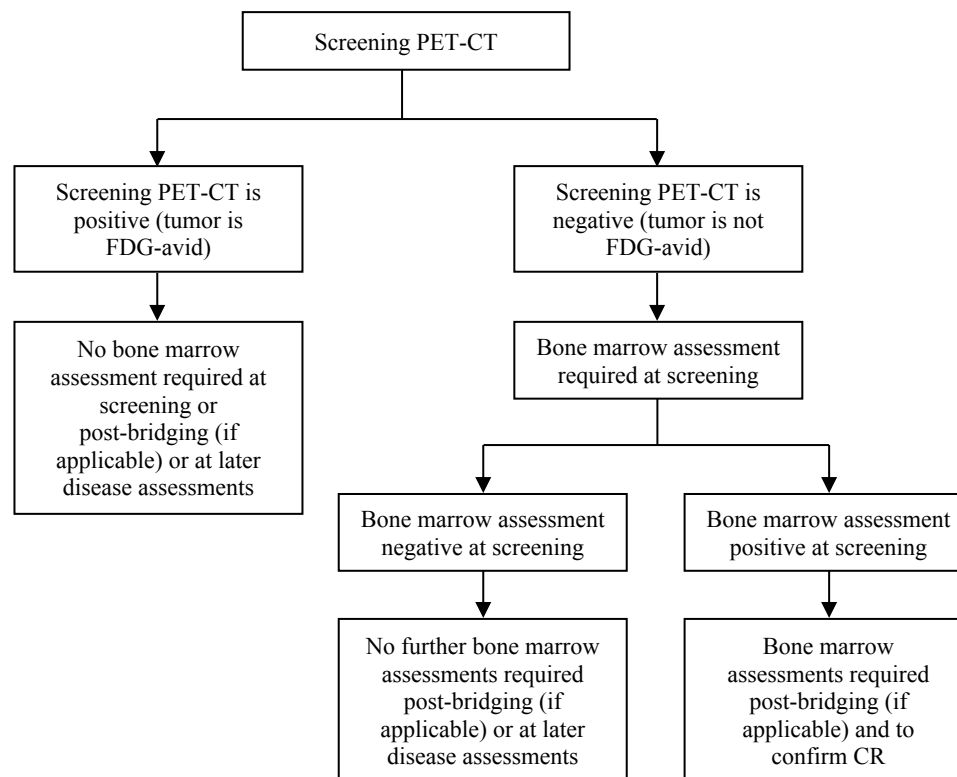

- For DLBCL-RT, the assessment of bone marrow involvement will be in accordance with the Lugano Classification, and a bone marrow aspirate and biopsy are only indicated if the DLBCL-RT is not FDG-avid. If the required screening bone marrow assessment in this case is positive, further bone marrow assessments are required to confirm a CR at the disease response assessment time points outlined in the SOA ([Figure 1](#)).
- To confirm a CR, the bone marrow aspirate and biopsy must show no evidence of disease by morphology or, if indeterminate by morphology, must be negative by immunohistochemistry.

Figure 1. Bone Marrow Assessment Schema

CLL Bone Marrow Assessment Requirements

**DLBCL-RT Bone Marrow Assessment Requirements
(if not already collected as part of the CLL component)**

Abbreviations: CLL, chronic lymphocytic leukemia; CR, complete response; CRi, complete response with incomplete marrow recovery; DLBCL, diffuse large B-cell lymphoma; FDG, fluorodeoxyglucose; PET-CT, positron emission tomography-computed tomography; PD, progressive disease; PR, partial response; RT, Richter transformation; SD, stable disease.

Notes: All bone marrow assessments will be performed at the local laboratory. Bone marrow samples collected at screening and at progression or relapse (in subjects who achieve a CR of CLL; if collected per standard of care) should also be sent to the central laboratory (see Section 6.4.2 and the central laboratory manual).

6.4.3. Hematology Assessment

Local laboratory measurement of blood lymphocytes, platelet count, and hemoglobin are required at screening, after bridging therapy (if applicable), and at all time points indicated in the SOA for CLL disease response assessments, per the IWCLL 2018 criteria.

6.4.4. CLL Measurable Residual Disease Assessment

Measurable residual disease (MRD) assessments by evaluation of bone marrow aspirate or peripheral blood will be performed by the investigator at their local laboratory at Day 28 and Month 3, as specified in the SOA (see Section 12.2).

Beyond Month 3 and through Month 24, MRD should also be assessed when the subject's hematological and radiological response is consistent with CR/CRi, in order to establish/re-confirm a CR/CRi with MRD negative response per IWCLL 2018 criteria.

Details of the sample used for the assessment and the methodology used (eg, 6-color flow cytometry, allele-specific oligonucleotide polymerase chain reaction [PCR], or high-throughput sequencing) will be reported in the eCRF.

6.5. Clonality Assessment

To retrospectively assess the clonal relationship of the DLBCL to the underlying CLL, the *IGHV* gene will be sequenced and compared between the CLL tumor cells (from screening bone marrow aspirate) and the DLBCL cells (from the tumor biopsy). The analysis can be done by bulk sequencing and without prior CLL cell isolation if the immunophenotype of bone marrow cells is able to exclude the presence of DLBCL cells; otherwise, isolation of CLL based on cell surface markers (eg, CD43) should be done before bulk sequencing. Sample collection is described in Section 6.6.

6.6. Tumor Biopsy

Screening:

To retrospectively confirm eligibility, archival tumor biopsy collected after the original diagnosis of RT must be submitted to the central laboratory for confirmation of diagnosis. This will consist of either 1 formalin-fixed paraffin-embedded tumor block or at least 20 unstained slides. Should an archived tumor sample be unavailable or insufficient, a fresh tumor sample is required to be obtained before initiation of lymphodepleting chemotherapy. However, a new biopsy is only to be acquired if the location is easily accessible, and if appropriate taking into account subject safety.

In addition, to investigate clonal relationship to the underlying CLL, archived and cryopreserved or freshly collected and snap-frozen tumor biopsy must be submitted to the central laboratory.

Disease Progression:

If a tumor biopsy that is clinically indicated in the management of a study treated subject is acquired, a portion of the biopsy should be sent to the central laboratory for additional exploratory analyses.

Refer to Section 6.7 for details on tumor biopsies for exploratory analyses.

6.7. Disease-specific Exploratory Assessments

Peripheral blood from screening and either archived (at time of RT diagnosis) or fresh tumor biopsy samples will be collected in order to perform genetic testing for evaluation of mutations in *CDKN2A*, *NOTCH1*, *MYC*, and *TP53* to confirm the RT diagnosis and for use as prognostic markers in exploratory analyses.

In addition, exploratory analysis of peripheral blood and, where applicable, bone marrow aspirates might include evaluation of Vysis fluorescence in situ hybridization (FISH) testing (p53 del17p; ATM del11q; Del 13q; Trisomy 12) and cytogenetics (chromosome/karyotype analysis) of the underlying CLL disease. Single-cell transcriptomics and proteomics of immune cell subsets in pre- and post-infusion peripheral blood mononuclear cells might be performed to uncover mechanisms of treatment resistance.

7. STUDY PROCEDURES UNIQUE TO RICHTER TRANSFORMATION

Refer to Section 7 of the KT-US-568-0138 master protocol for the list of procedures for this study. Additional procedures for this RT subprotocol are listed below.

For short-term disease control, optional bridging therapy is allowed per investigator discretion. To exclude any impact of bridging therapy, a new baseline for subjects receiving bridging therapy is required as outlined in the SOA.

7.1. Screening

Subjects currently on a BTK inhibitor when entering the screening period may continue (if on ibrutinib) or should be switched to ibrutinib (if on other BTK inhibitor treatment), which may be used through leukapheresis and up to 5 half-lives (30 hours) prior to the start of lymphodepletion (refer to Section 5.2).

7.2. Optional Bridging Therapy

Bridging therapy will be permitted at the discretion of the investigator, if deemed required to control disease after leukapheresis. Bridging therapy is recommended for subjects with high disease burden. Bridging therapy may be administered after leukapheresis, and the last dose of any bridging therapy regimen must be completed at least 7 days or 5 half-lives, whichever is shorter, before initiating lymphodepleting chemotherapy.

If a subject receives any bridging therapy between leukapheresis and lymphodepleting chemotherapy, then the baseline imaging and any additional assessments to confirm measurable disease must be repeated after the bridging therapy and before lymphodepleting chemotherapy commences to establish a new baseline. For subjects who receive irradiation as bridging therapy, irradiated lesions can no longer serve as target lesions, and other target lesions must be present to allow for response assessment.

CCI

The procedures to be performed during the period in which bridging therapy is administered are detailed in the SOA (Section 12.2).

8. ADVERSE EVENTS AND TOXICITY MANAGEMENT

Refer to Section 8 of the KT-US-568-0138 master protocol for adverse events and toxicity management. The SRT and independent DSMB for this subprotocol are described below.

8.1. Safety Review Team and Data Safety Monitoring Board

An SRT, comprising the study sponsor and at least 1 study investigator, will be specifically chartered to review the safety data and make recommendations on further study conduct, progression, and/or dose modification after 3 to 6 subjects in this substudy have been treated with the initial dose (2×10^6 anti-CD19 CAR T cells/kg of body weight) and followed for 28 days, as detailed in the KT-US-568-0138 master protocol.

An independent DSMB will be chartered to review safety and efficacy data to make study conduct recommendations based on an analysis of risk versus benefit. The DSMB will review investigator-reported safety and efficacy data against the futility rules after 20 subjects (33%) in this substudy have been treated with the SRT-recommended dose of brexucabtagene autoleucel and have had the opportunity to be followed for 3 months after the brexucabtagene autoleucel infusion. Study enrollment will be paused following treatment of the 20th subject with brexucabtagene autoleucel and until results from this interim analysis have been assessed. The DSMB will also review serious adverse event (SAE) information (listings or narratives) and suspected unexpected serious adverse reactions (SUSARs) on a regular basis throughout subject treatment in the study and per the DSMB charter or DSMB discretion. The DSMB may request additional safety or efficacy data or recommend modifying the study conduct. The sponsor may request additional reviews by the DSMB. Data submitted to the DSMB may or may not be source data verified to facilitate timely DSMB review.

SUSARs and SAE listings or narratives may be submitted to the DSMB chair as described in the DSMB charter.

Additional details regarding the SRT, DSMB, and dose-limiting toxicities are provided in Section 8.10.1, Section 8.10.2, and Section 8.1.2 of the KT-US-568-0138 master protocol, respectively.

9. STATISTICAL CONSIDERATIONS

An overview of the statistical considerations that are specific to this subprotocol are provided below. Refer to Section 9 of the KT-US-568-0138 master protocol for an overview of the statistical considerations that are common across indications.

Details of the statistical analysis plan (SAP) will be provided in the SAP document.

9.1. Hypothesis

An alternative hypothesis is proposed with a target 50% ORR per central assessment against a null hypothesis that the ORR is $\leq 28\%$. The reference rate of 28% was based on a systematic literature review and meta-analysis {[Abrisqueta 2020](#), [Davids 2017](#), [Ding 2017](#), [Faderl 2003](#), [Thompson M C 2021](#), [Visentin A 2017](#)}. The hypothesis is that the ORR to brexucabtagene autoleucel per central assessment is greater than 28%.

The hypothesis testing will be conducted at a significance level of 0.025 (1-sided). The responses from subjects in the study population are assumed to be independent and follow a binomial distribution.

9.2. Definition of Substudy Endpoints

In addition to the secondary and exploratory endpoints detailed in the KT-US-568-0138 master protocol, the endpoints outlined below also apply to this substudy.

9.2.1. Definition of Substudy Primary Endpoints

The primary endpoint for this substudy is the ORR, defined as the proportion of subjects who achieve a best response of either CR or PR, by central assessment per the Lugano Classification {[Cheson 2014](#)}.

9.2.2. Definition of Substudy Secondary Endpoints

Secondary endpoints for this substudy are defined in [Table 3](#).

Table 3. Definitions of Substudy Secondary Endpoints

Secondary Endpoint	Definition
ORR in DLBCL-RT by investigator assessment	Proportion of subjects who achieve a best response of either CR or PR by investigator assessment per the Lugano Classification {Cheson 2014}
ORR in DLBCL-RT based on clonal relationship to the underlying CLL by central assessment	Proportion of subjects who achieve a best response of either CR or PR by central assessment per the Lugano Classification {Cheson 2014}, in subgroups by clonal relationship to the underlying CLL. Clonality will be assessed by central assessment.
ORR in CLL by investigator assessment	Proportion of subjects who achieve a best response of either CR, CRi, or PR by investigator assessment per IWCLL 2018 criteria {Hallek 2018}

Abbreviations: CLL, chronic lymphocytic leukemia; CR, complete response; CRi, complete response with incomplete marrow recovery; DLBCL, diffuse large B-cell lymphoma; IWCLL, International Workshop on Chronic Lymphocytic Leukemia; ORR, objective response rate; PR, partial response; RT, Richter transformation.

9.2.3. Definition of Other Substudy Endpoints of Interest

Exploratory endpoints for this substudy are defined in Table 4.

Table 4. Definitions of Substudy Exploratory Endpoints

Exploratory Endpoint	Definition
Rate of MRD negative response of CLL among subjects who have achieved a CR	Incidence of an MRD negative response among subjects who achieve a CR, where MRD negative is defined as MRD < 10 ⁻⁴ per the standard assessment as done by the local laboratory
ORR in DLBCL-RT based on receipt of bridging therapy	Proportion of subjects who achieve a best response of either CR or PR, in subgroups by receipt of bridging therapy (yes/no)

Abbreviations: CLL, chronic lymphocytic leukemia; CR, complete response; DLBCL, diffuse large B-cell lymphoma; MRD, measurable residual disease; ORR, objective response rate; PR, partial response; RT, Richter transformation.

9.3. Determination of Sample Size

This single-arm, open-label substudy will enroll and treat 60 subjects with the SRT-recommended dose of brexucabtagene autoleucl. This sample size will achieve a statistical power of $\geq 90\%$ if there is at least a 22% improvement in ORR (brexucabtagene autoleucl: 50% versus historical control: 28%) with a type 1 error rate of 0.025 (1-sided) under the 2-look design based on normal approximation, with variance of standardized test statistic under null hypothesis (H_0) using EAST (Version 6.5). The empirical power is 91% per simulation based on binomial distribution without normal approximation. Statistically significant treatment effect can be claimed in this substudy if ≥ 24 responders ($\geq 40.0\%$) are observed among the 60 subjects at the primary analysis.

9.4. Planned Analyses

9.4.1. Interim Analysis and Early Stopping Guidelines

An interim analysis will be conducted after 20 subjects (33%) have had the opportunity to be evaluated for response 3 months after treatment with brexucabtagene autoleucel. Study enrollment will be paused following treatment of the 20th subject with brexucabtagene autoleucel and until results from this interim analysis have been assessed. In this interim analysis, the DSMB will review investigator-reported data for both safety and efficacy (futility only). The non-binding futility boundary is ORR of 30.4% based on the beta spending function of rho family (parameter = 0.6), with a crossing probability of 59% under the null hypothesis ($ORR \leq 28\%$). The futility boundary is crossed if ≤ 6 responders are observed among the 20 subjects. A decision will be made by the sponsor based on DSMB recommendation, with the complete benefit/risk profile of brexucabtagene autoleucel being taken into account. If the decision is made to discontinue the substudy, then this analysis will be considered the primary analysis of this substudy.

9.4.2. Primary Analysis

If the decision based on the interim analysis is to continue the substudy, a primary analysis will be conducted after 60 subjects have been enrolled and treated with the SRT-recommended dose of brexucabtagene autoleucel (modified intent-to-treat [mITT] analysis set) and the last subject has had the opportunity to be assessed for response at least 6 months after the brexucabtagene autoleucel infusion.

Hypothesis testing will be based on the number of objective responders observed among the 60 subjects, as described above. The point estimate of the ORR will be calculated, together with its 95% confidence interval using the Clopper-Pearson method. The p-value will be calculated based on exact test. If more than 60 subjects are treated with the SRT-recommended dose in this substudy by the time of data cutoff, all treated subjects will be included in the primary analysis.

9.4.3. Follow-Up Analysis

A follow-up analysis may be performed after all treated subjects have had the opportunity to be assessed for response at least 18 months after the brexucabtagene autoleucel infusion to further evaluate the risk-benefit profile of brexucabtagene autoleucel, including the durability of response. This analysis will be descriptive.

Additional descriptive analyses may occur after the primary analysis and follow-up analysis described above have been completed.

9.4.4. Final Analysis

The duration of the study is 24 months. The final analysis will be performed after all subjects have completed the study, outstanding data queries have been resolved or adjudicated as unresolvable, and the data have been cleaned and finalized.

10. RESPONSIBILITIES

Please refer to Section 10 of the KT-US-568-0138 master protocol for details regarding investigator and sponsor responsibilities.

INVESTIGATOR STATEMENT

I have read the protocol, including all appendices, and I agree that it contains all necessary details for me and my staff to conduct this study as described. I will conduct this study as outlined herein and will make a reasonable effort to complete the study within the time designated.

I agree to comply with the International Council for Harmonisation of Technical Requirements for Pharmaceuticals for Human Use (ICH) Harmonised Tripartite Guideline on Good Clinical Practice and applicable national or regional regulations and guidelines. I will provide all study personnel under my supervision copies of the protocol and access to all information provided by Kite Pharma, Inc. I will discuss this material with them to ensure that they are fully informed about the investigational product and study.

I agree and will ensure that financial disclosure statements will be completed by:

- Me (including, if applicable, my spouse, legal partner, and dependent children)
- Subinvestigators (including, if applicable, their spouse, legal partner, and dependent children) at the start of the study and for up to 1 year after the study is completed.

I agree to ensure that the confidential information contained in this document will not be used for any purpose other than the conduct of the clinical investigation without prior written consent from Kite Pharma, Inc.

Abbreviations: approx., approximately; ASCO, American Society of Clinical Oncology; CAR, chimeric antigen receptor; CBC, complete blood count; CLL, chronic lymphocytic leukemia; CNS, central nervous system; CR, complete response; CrCl, creatinine clearance; CrI, complete response with incomplete marrow recovery; CRP, C-reactive protein; CRS, cytokine release syndrome; CSF, cerebrospinal fluid; CT, computed tomography; D/d, day; DLBCL, diffuse large B-cell lymphoma; ECG, electrocardiogram; ECHO, echocardiogram; ECOG, Eastern Cooperative Oncology Group; EORTC-QLQ-C30, European Organization for Research and Treatment of Cancer Quality of Life Questionnaire; EQ-5D-5L, European Quality of Life 5-Dimension 5-Level scale; EU, European Union; FDG, fluorodeoxyglucose; hCG, human chorionic gonadotropin; ICANS, immune effector cell-associated neurotoxicity syndrome; ICE, immune effector cell-associated encephalopathy; ICF, informed consent form; IV, intravenous; IWCLL, International Workshop on Chronic Lymphocytic Leukemia; LDH, lactate dehydrogenase; LVEF, left ventricular ejection fraction; M, month; MRD, measurable residual disease; MRI, magnetic resonance imaging; MUGA, multigated acquisition scan; PBMC, peripheral blood mononuclear cell; PET, positron emission tomography; PR, partial response; PRO, patient-reported outcome; QOD, every other day; RCR, replication-competent retrovirus; RT, Richter transformation; SOA, schedule of assessments; SOC, standard of care; W/w, week; WOCBP, women of childbearing potential.

Note: Please refer to the footnotes listed below in parallel with Section 6 of this protocol and the KT-US-568-0138 master protocol.

- a For EU and CH, post-infusion monitoring extended by monitoring on Days 8, 9, and 10 (vital signs, blood draw for chemistry panel with CRP and CBC and neurological examination). For EU, the subject may remain hospitalized or return to the clinic daily for this extended monitoring, at the discretion of the investigator. For CH, patients must remain hospitalized.
- b Subjects with symptoms suggestive of disease progression should be evaluated for progression at the time symptoms occur, even if this requires an unscheduled visit.
- c Physical examination will include assessment of splenomegaly and lymphadenopathy. Subjects with symptoms or clinical signs related to CRS should undergo physical examination at least daily until symptoms resolve to baseline.

- d Vital signs will include blood pressure, heart rate, respiration rate, oxygen saturation, and temperature. It is recommended that vital signs are monitored during and after study treatment and then routinely per institutional guidelines. Vital signs may be monitored more frequently as clinically indicated.
- e Neurologic examination: A neurologic examination, including an ICE cognition assessment, should be performed on Day 0 before the brexucabtagene autoleucel infusion and should be performed every other day during the hospitalization period. If a subject hospitalization is extended beyond Day 7, a neurologic examination including a cognition assessment will continue to be performed as clinically indicated.
- f Brain MRI:
- Screening through start of lymphodepletion: At screening, subjects with current symptoms or clinical signs of CNS malignancy, such as severe headaches, neck stiffness, seizures, encephalopathy, cranial nerve deficits, or any focal neurological findings on physical examination, must undergo brain MRI to rule out current CNS metastasis, in which case such subjects are not eligible for the study. After the initial screening and eligibility confirmation, if the subject presents with new-onset symptoms or clinical signs of CNS malignancy/disease, a repeat MRI is required to reassess eligibility prior to the start of lymphodepleting chemotherapy (see Section 6.2).
 - Post-infusion: Subjects with new-onset symptoms of CNS malignancy/disease, as described above, are recommended to have a brain MRI. In addition, in the case of CRS and ICANS, refer to the ASCO management guidelines for guidance of requirements for brain imaging {[Santomasso 2021](#)}. In summary: i) brain MRI can be considered for all grades of CRS; ii) brain MRI or other neuroimaging can be considered for ICANS Grade 2 or higher, as supported by the ASCO management guidelines.
- g Lumbar puncture: Opening pressures should be measured with each lumbar puncture when possible and recorded in the subject's site chart.
- Screening: Subjects with symptoms or clinical signs of CNS malignancy (eg, new-onset severe headaches, neck stiffness, or focal neurologic findings) or leptomeningeal carcinomatosis will have a lumbar puncture performed at screening for examination of CSF to determine the presence of CNS malignancy. There must be no evidence of CNS involvement to be eligible for this study. After the initial screening and eligibility confirmation, if the subject presents with new-onset symptoms or clinical signs of CNS malignancy/disease, a repeat lumbar puncture is required to reassess eligibility prior to the start of lymphodepleting chemotherapy.
 - Post-infusion: Subjects with symptoms or clinical signs of CNS malignancy, such as new-onset severe headaches, neck stiffness, seizures, encephalopathy, cranial nerve deficits, or any focal neurologic findings on physical examination, will have a lumbar puncture for examination of CSF, including sending a sample to the central laboratory. In the case of CRS and ICANS, refer to the ASCO management guidelines for guidance for requirements for lumbar puncture examination {[Santomasso 2021](#)}. In summary: i) lumbar puncture is recommended for consideration in cases of CRS; ii) for ICANS, a lumbar puncture is recommended for Grade 3 or higher neurotoxicity and may be considered for Grade 2 (see Section 6.3).
- h PROs are to be completed by the subject before any study-specific assessments or procedures are performed (excluding blood draws) and before the subject receives any disease status information or the brexucabtagene autoleucel infusion on Day 0.
- i PET-diagnostic CT:
- Screening/baseline: PET-CT scan should be performed as close to enrollment/leukapheresis as possible and within 28 days before leukapheresis for eligibility (unless imaging is available from SOC assessment within 28 days before enrollment). If a PET-CT scan is performed > 28 days before the initiation of lymphodepleting chemotherapy or if the subject receives any anticancer therapy (bridging therapy) between the last PET-CT scan and initiation of lymphodepleting chemotherapy, a new baseline PET-CT scan must be performed before lymphodepleting chemotherapy.
 - Disease assessment: PET-CT is required for each disease response assessment per the SOA and at any time disease progression is suspected.
 - To limit radiation exposure, investigators are encouraged to leave at least 4 weeks between consecutive scans.
- j Bone marrow aspirate and biopsy:
- Screening/baseline:
- Bone marrow aspirate and biopsy samples are required in all subjects at screening and after bridging therapy (if applicable), in order to assess the underlying CLL and to assess DLBCL-RT in case of a negative screening PET-CT (non-FDG-avid tumor).
 - At screening, bone marrow samples are also required to be sent to the central laboratory for retrospective central confirmation of disease diagnosis (refer to the central laboratory manual for details).

Disease/response assessment:

- For CLL: A bone marrow aspirate and biopsy are required at Day 28 and Month 3 for the underlying CLL response assessment. Beyond Month 3 and through Month 24, further bone marrow assessment is only required at Month 12 and Month 24, only in those subjects who responded (CR, CRi, or PR) at Month 3, in order to confirm CR per IWCLL 2018 criteria {Hallek 2018} (see Section 6.4.2). To confirm a CR, the bone marrow aspirate and biopsy must show no evidence of disease by morphology or, if indeterminate by morphology, must be negative by immunohistochemistry. In subjects who experience disease progression or who achieve a CR of CLL but subsequently relapse, if a bone marrow aspirate (that is clinically indicated in the management of a study treated subject) is acquired, a portion of the aspirate should be sent to the central laboratory if feasible for additional exploratory analyses (refer to the central laboratory manual for details).
 - For DLBCL-RT: The assessment of bone marrow involvement will be in accordance with the Lugano Classification {Cheson 2014}, and a bone marrow aspirate and biopsy are only indicated if the DLBCL-RT is not FDG-avid. If the required screening bone marrow assessment in this case is positive, further bone marrow assessments are required to confirm a CR. To confirm a CR, the bone marrow aspirate and biopsy must show no evidence of disease by morphology or, if indeterminate by morphology, must be negative by immunohistochemistry.
- k Bone marrow or peripheral blood assessment of MRD for CLL: To be performed at Day 28 and Month 3. Beyond Month 3 and through Month 24, MRD should also be assessed when the subject's hematological and radiological response is consistent with CR/CRi, in order to establish/re-confirm a CR/CRi with MRD negative response per IWCLL 2018 criteria.
- l Archived/fresh tumor sample(s):
- Screening: Archival tumor biopsy collected after the original diagnosis of RT must be submitted to the central laboratory. Archived tumor biopsy samples will consist of either 1 formalin-fixed paraffin-embedded tumor block or at least 20 unstained slides. Should an archived tumor sample be unavailable or insufficient, a fresh tumor sample is required to be obtained before initiation of lymphodepleting chemotherapy. In addition, to investigate clonal relationship to the underlying CLL, archived and cryopreserved or freshly collected and snap-frozen tumor biopsy must be submitted to the central laboratory.
 - Disease progression: If a tumor biopsy that is clinically indicated in the management of a study-treated subject is acquired, a portion of the biopsy should be sent to the central laboratory for additional exploratory analyses.
- m Assessments may be performed on the day before administration of brexucabtagene autoleucel (ie, on Day -1). For tests performed at the central laboratory, this decision will be driven by the availability of the central laboratory to process samples on the day they are collected from the subject (refer to the laboratory manual for holidays). For samples collected on Day 0, collection will occur before the start of the brexucabtagene autoleucel infusion.
- n LDH should continue to be monitored after the baseline assessment as clinically indicated.
- o Pregnancy test (serum or urine): For EU/CH study sites, the test will be completed within 7 days before both leukapheresis and lymphodepleting chemotherapy for females of childbearing potential.
- p Serology tests for EU/CH study sites (serum): Serology tests (ie, HIV, hepatitis B virus, hepatitis C virus, and syphilis) will be done per institutional guidelines and EU/CH regulations. Testing may be done within the 30 days before leukapheresis/enrollment and/or on the day of leukapheresis/enrollment.
- q Hepatitis B and C testing is also required at screening.
- r CBC with differential (blood): At the time points at which PBMC samples are collected for analysis of brexucabtagene autoleucel CAR T-cell levels, blood samples will also be collected and sent to the central laboratory for assessment of CBC with differential (these samples are in addition to samples collected at the specified time points and that are sent to the local laboratory for assessment of CBC with differential for clinical/safety evaluation).
- s Baseline for assessments of brexucabtagene autoleucel CAR T cells and analytes: A sample will be collected at enrollment/before the leukapheresis procedure. Subjects who receive bridging therapy will also have a blood sample collected before receiving the first dose of lymphodepleting chemotherapy.
- t Analytes (including cytokines) (serum/plasma) and brexucabtagene autoleucel CAR T cells (PBMCs):
- Samples on Day 3 may be collected \pm 1 day
 - If a subject is re-admitted to the hospital after the initial hospitalization observation period with any brexucabtagene autoleucel-related adverse events, blood samples for assessment of brexucabtagene autoleucel CAR T cells and serum analytes will be collected on the day of hospital re-admission and then weekly through, and including, the day of discharge, if the samples were not already collected on the same days as per the SOA (ie, 2 identical collections on the same day are not needed).

- If the subject experiences a Grade 3 or higher brexucabtagene autoleucel-related toxicity, such as Grade 3 CRS or neurologic event, 1 additional blood draw for brexucabtagene autoleucel CAR T cells (PBMCs) and serum analytes will be collected at the time of the Grade 3 or higher brexucabtagene autoleucel-related toxicity and upon resolution of the event, if the samples were not already collected on the same days as per the SOA (ie, 2 identical collections on the same day are not needed).
 - Blood samples for assessment of brexucabtagene autoleucel CAR T cells and serum analytes should be collected at the time of disease progression prior to starting subsequent anticancer therapy.
 - Exploratory T-cell immunogenicity will be performed with PBMCs at leukapheresis and Month 3. Extra blood collection is required for such testing.
 - Exploratory analyses will include lymphocyte subsets.
- u RCR (PBMCs):
- Samples will be collected at baseline (before CAR T-cell infusion) and at Month 3.
 - If a subject develops a secondary malignancy during the study, every effort should be made to obtain a blood sample to assay for RCR and vector elements. In the case of a secondary malignancy, every effort will be made to obtain a blood sample (PBMC) and biopsy sample of the neoplastic tissue or the pertinent autopsy tissue to start a testing workflow, including tests such as transgene elements, RCR, presence of common cancer-drivers/mutations and insertional mutagenesis (see Section 6.3.15.3 of the KT-US-568-0138 master protocol).
- v Bridging therapy may be administered per investigator discretion if deemed required for disease control. Refer to Section 7.2 for details.
- w Mesna will be administered around the time of the cyclophosphamide dose according to institutional standards (refer to Section 5.1.2.3 and Section 7.5.3 of the KT-US-568-0138 master protocol).
- x Collection of serious adverse events starts from signing of the screening ICF, and collection of adverse events starts from commencement of the leukapheresis procedure.

- c PROs are to be completed before any assessments or procedures are performed (excluding blood draws) and before the subject receives any disease status information.
- d PET-diagnostic CT: PET-CT is required for each disease response assessment per the SOAs and at any time disease progression is suspected. To limit radiation exposure, investigators are encouraged to leave at least 4 weeks between consecutive scans.e Bone marrow aspirate and biopsy:
 - For CLL: Beyond Month 3 and through Month 24, further bone marrow assessment is only required at Month 12 and Month 24, only in those subjects who responded (CR, CRi, or PR) at Month 3, in order to confirm CR per IWCLL 2018 criteria (see Section 6.4.2). To confirm a CR, the bone marrow aspirate and biopsy must show no evidence of disease by morphology or, if indeterminate by morphology, must be negative by immunohistochemistry. In subjects who experience disease progression or who achieve a CR of CLL but subsequently relapse, if a bone marrow aspirate (that is clinically indicated in the management of a study-treated subject) is acquired, a portion of the aspirate should be sent to the central laboratory if feasible for additional exploratory analyses (refer to the central laboratory manual for details).
 - For DLBCL-RT: The assessment of bone marrow involvement will be in accordance with the Lugano Classification, and a bone marrow aspirate and biopsy are only indicated if the DLBCL-RT is not FDG-avid. If the required screening bone marrow assessment in this case is positive, further bone marrow assessments are required to confirm a CR. To confirm a CR, the bone marrow aspirate and biopsy must show no evidence of disease by morphology or, if indeterminate by morphology, must be negative by immunohistochemistry.
- f Bone marrow or peripheral blood assessment of MRD for CLL: Beyond Month 3 and through Month 24, MRD should also be assessed when the subject's hematological and radiological response is consistent with CR/CRi, in order to establish/re-confirm a CR/CRi with MRD negative response per IWCLL 2018 criteria.

- g CBC with differential (blood):
- Local laboratory assessments: Blood will be collected at the time points specified through Month 24 or until disease progression, whichever occurs first, and sent to the local laboratory for clinical/safety evaluation.
 - Central laboratory assessments: Blood will be collected at the time points specified through Month 24 and sent to the central laboratory for assessment of CBC with differential (these samples are in addition to samples collected at the specified time points that are sent to the local laboratory for assessment of CBC with differential for clinical/safety evaluation).
- h LDH should continue to be monitored after the baseline assessment as clinically indicated.
- i Analytes (including cytokines) (serum/plasma) and brexucabtagene autoleucl CAR T cells (PBMCs):
- If a subject is re-admitted to the hospital after the initial hospitalization observation period with any brexucabtagene autoleucl-related AEs, blood samples for assessment of brexucabtagene autoleucl CAR T cells and serum analytes will be collected on the day of hospital re-admission and then weekly through, and including, the day of discharge, if the samples were not already collected on the same days as per the SOA (ie, 2 identical collections on the same day are not needed).
 - If the subject experiences a Grade 3 or higher brexucabtagene autoleucl-related toxicity, such as Grade 3 CRS or neurologic event, 1 additional blood draw for brexucabtagene autoleucl CAR T cells (PBMCs) and serum analytes will be collected at the time of the Grade 3 or higher brexucabtagene autoleucl-related toxicity and upon resolution of the event, if the samples were not already collected on the same days as per the SOA (ie, 2 identical collections on the same day are not needed).
 - Blood samples for assessment of brexucabtagene autoleucl CAR T cells and serum analytes should be collected at the time of disease progression prior to starting subsequent anticancer therapy.
 - Exploratory analyses will include lymphocyte subsets.
- j RCR (PBMCs):
- Samples will be collected at Month 6 and Month 12 and analyzed. Additional samples will be collected and analyzed only if an RCR event is clinically suspected and/or a subject's PBMC sample tests positive for RCR at any time point within the first 12 months following brexucabtagene autoleucl infusion.
 - If a subject develops a secondary malignancy during the study or follow-up and RCR is suspected, every effort should be made to obtain a blood sample to assay for RCR and vector elements. In the case of a secondary malignancy, every effort will be made to obtain a blood sample (PBMC) and biopsy sample of the neoplastic tissue or the pertinent autopsy tissue to start a testing workflow, including tests such as transgene elements, RCR, presence of common cancer-drivers/mutations and insertional mutagenesis (see Section 6.3.15.3 of the KT-US-568-0138 master protocol).
- k If a tumor biopsy that is clinically indicated in the management of a study-treated subject is acquired, a portion of the biopsy should be sent to the central laboratory for additional exploratory analyses.
- l Targeted AEs/SAEs include neurologic events, hematologic events, serious infections, autoimmune disorders, and secondary malignancies. From 3 months after the brexucabtagene autoleucl infusion, targeted AEs/SAEs will be reported through Month 24 after the initial brexucabtagene autoleucl infusion or until disease progression and/or the start of subsequent anticancer therapy, whichever occurs first. After Month 24, the subject will transition to the LTFU study where targeted AEs/SAEs will be reported through 15 years. All new malignancies (defined as the development of any new malignancies occurring after the administration of brexucabtagene autoleucl) are to be reported; however, only secondary malignancies (defined as the development of any new malignancy suspected to be possibly related to brexucabtagene autoleucl) are considered to be targeted AEs/SAEs.
- m Targeted concomitant medications will be collected up to 24 months after the brexucabtagene autoleucl infusion or until disease progression or the start of subsequent anticancer therapy, whichever occurs first. (Reporting will continue through 60 months as part of the LTFU study.)
- n Subsequent anticancer therapy administered after brexucabtagene autoleucl infusion for a subject's disease will be collected until 1 of the following occurs: subject completes the post-treatment follow-up period, is considered lost to follow-up, withdraws consent, or dies. The subject and/or the referring HCP and/or GP may be contacted directly by telephone or email to collect information about subsequent therapy.
- o Subject and/or referring HCP and/or GP may be contacted directly by telephone or email to assess survival status.

12.3. Disease Response Criteria

12.3.1. International Working Group Lugano Classification (Richter Transformation)

Disease assessments are to be performed according to the International Working Group Lugano Response Criteria for Malignant Lymphoma {Cheson 2014}; refer also to instructions provided in the study imaging manual.

The Deauville 5-point scale (5PS) is used for positron emission tomography (PET) scoring; the scores and their descriptions are presented in Table 7.

Table 7. Deauville 5-point Scale for Positron Emission Tomography Scoring

Score	Description
1	No uptake above background
2	Uptake \leq mediastinum
3	Uptake $>$ mediastinum but \leq liver
4	Uptake moderately higher than liver
5	Uptake markedly higher than liver and/or new lesions
X	New areas of uptake unlikely to be related to lymphoma

Source: {Cheson 2014}.

12.3.1.1. Complete Remission

12.3.1.1.1. Complete Metabolic Response for PET–Computed Tomography-based Response

The designation of complete metabolic response requires all of the following:

- A 5PS score of 1, 2, or 3, with or without a residual mass:
 - In Waldeyer’s ring or extranodal sites with high physiologic uptake or activation within the spleen or marrow, uptake may be greater than normal in the mediastinum and/or liver. In this circumstance, complete metabolic response may be inferred if uptake at sites of initial involvement is no greater than surrounding normal tissue even if the tissue has high physiologic uptake.
- No new sites of disease should be observed
- No evidence of fluorodeoxyglucose (FDG)-avid disease in bone marrow

12.3.1.1.2. Complete Radiologic Response for Computed Tomography-based Response

The designation of complete radiologic response requires all of the following:

- Target nodes/nodal masses must regress to ≤ 1.5 cm in longest transverse diameter (LDi) of a lesion
- No extra lymphatic sites of disease
- Absent nonmeasured lesion
- Organ enlargement regress to normal
- No new sites of disease should be observed
- Bone marrow normal by morphology; if indeterminate, immunohistochemistry negative

12.3.1.2. Partial Remission

12.3.1.2.1. Partial Metabolic Response for PET–Computed Tomography-based Response

The designation of partial metabolic response requires all of the following:

- A 5PS score of 4 or 5, with reduced uptake compared to baseline (screening), and residual mass(es) of any size.

Note:

- At the interim, these findings suggest responding disease
- At the end of treatment, these findings suggest residual disease

- No new sites of disease should be observed
- Residual uptake is higher than uptake in normal bone marrow but reduced compared with baseline (diffuse uptake is compatible with reactive changes from chemotherapy allowed)

If there are persistent focal changes in the marrow in the context of a nodal response, consideration should be given to further evaluation with magnetic resonance imaging or biopsy or an interval scan.

12.3.1.2.2. Partial Radiologic Response for Computed Tomography-based Response

The designation of partial radiologic response requires all of the following:

- $\geq 50\%$ decrease in the sum of the product of the perpendicular diameters of up to 6 target measurable nodes and extranodal sites.
 - When a lesion is too small to measure on a computed tomography (CT) scan, assign $5\text{ mm} \times 5\text{ mm}$ as the default value

- When the lesion is no longer visible, assign 0 x 0 mm
- For a node > 5 mm × 5 mm, but smaller than normal, use the actual measurement for calculation
- Absent/normal, regressed, but no increase of nonmeasured lesions
- Spleen must have regressed by > 50% in length beyond normal
- No new sites of disease should be observed

12.3.1.3. Stable Disease

12.3.1.3.1. No Metabolic Response for PET–CT-based Response

The designation of no metabolic response requires all of the following:

- A 5PS score of 4 or 5, with no significant change in FDG uptake compared with baseline (screening) at an interim time point or the end of treatment
- No new sites of disease should be observed
- No change from baseline in bone marrow

12.3.1.3.2. Stable Radiologic Disease for CT-based Response

The designation of stable radiologic disease requires all of the following:

- < 50% decrease from baseline in the sum of the product of the perpendicular diameters of up to 6 dominant, measurable nodes and extranodal sites; no criteria for progressive disease (PD) are met
- No increase consistent with progression in nonmeasured lesion and organ enlargement
- No new sites of disease should be observed

12.3.1.4. Progressive Disease

12.3.1.4.1. Progressive Metabolic Disease for PET–CT-based Response

The designation of progressive metabolic disease requires at least 1 of the following:

- A 5PS score 4 or 5 with an increase in intensity of uptake from baseline nadir and/or
- New FDG-avid foci consistent with lymphoma at an interim time point or the end of treatment assessment

- New FDG-avid foci consistent with lymphoma rather than another etiology (eg, infection or inflammation). If uncertain regarding the etiology of new lesions, a biopsy or interval scan may be considered
- New or recurrent FDG-avid foci in bone marrow

12.3.1.4.2. Progressive Radiologic Disease for CT-based Response

The designation of progressive radiologic disease requires at least 1 of the following:

- An individual node/lesion must be abnormal with:
 - $LDi > 1.5$ cm, and
 - An increase by $\geq 50\%$ from the cross product of LDi and perpendicular diameter nadir, and
 - An increase in LDi or shortest transverse diameter, shortest axis perpendicular to the LDi , (shortest transverse diameter) from nadir
 - 0.5 cm for lesions ≤ 2 cm
 - 1.0 cm for lesions > 2 cm
 - In the setting of splenomegaly, the splenic length must increase by $> 50\%$ of the extent of its prior increase beyond baseline (eg, a 15-cm spleen must increase to > 16 cm). If there is no prior splenomegaly, the spleen must increase by ≥ 2 cm from baseline
 - New or recurrent splenomegaly
- New or clear progression of preexisting nonmeasured lesions
- New lesion:
 - Regrowth of previously resolved lesions
 - A new node > 1.5 cm in any axis
 - A new extranodal site > 1.0 cm in any axis; if < 1.0 cm in any axis, its presence must be unequivocal and attributable to lymphoma
 - Assessable disease of any size unequivocally attributable to lymphoma
- New or recurrent bone marrow involvement

12.3.2. International Workshop on Chronic Lymphocytic Leukemia 2018 Criteria (Chronic Lymphocytic Leukemia)

The determination of chronic lymphocytic leukemia (CLL) response and progression will be based on standardized International Workshop on Chronic Lymphocytic Leukemia (IWCLL) 2018 criteria {Hallek 2018}, as presented in Table 8 and Table 9.

Table 8. International Workshop on Chronic Lymphocytic Leukemia 2018 Response Criteria

Parameter	CR	PR	PD	SD
Group A (indicating tumor load)				
Lymphadenopathy ^a	None \geq 1.5 cm	Decrease \geq 50%	Increase by \geq 50% or new lymph nodes \geq 1.5 cm	Change of -49% to +49%
Hepatomegaly	Liver size normal	Decrease \geq 50%	Increase by \geq 50%	Change of -49% to +49%
Splenomegaly	Spleen size < 13 cm	Decrease \geq 50%	Increase by \geq 50%	Change of -49% to +49%
Circulating lymphocyte count	< 4,000/ μ L	Decrease of \geq 50% from baseline	Increase by \geq 50% over baseline ^b to \geq 5,000/ μ L	Change of -49% to +49%
Group B (indicating function of the hematopoietic system)				
Platelet count	\geq 100,000/ μ L	\geq 100,000/ μ L or increase by \geq 50% from baseline	Decrease by \geq 50% from baseline due to CLL	Change of -49% to +49%
Hemoglobin	\geq 11 g/dL without red blood cell transfusions or erythropoietin support for at least 4 weeks	\geq 11 g/dL or increase by \geq 50% from baseline without red blood cell transfusions or erythropoietin support for at least 4 weeks	Decrease by \geq 2 g/dL	Increase < 11.0 g/dL or < 50% over baseline, or decrease < 2 g/dL
Bone marrow	Normocellular for age, no increase in CLL lymphocytes, no clonal B-lymphoid nodules ^c	CLL cells or clonal B-lymphoid nodules present	Increase in CLL cells by \geq 50% on successive biopsies	No change in marrow infiltrate

Abbreviations: CLL, chronic lymphocytic leukemia; CR, complete response; CRi, complete response with incomplete marrow recovery; PD, progressive disease; PR, partial response; SD, stable disease.

a Assessed as sum of the products of up to 6 lymph nodes.

b Subjects with treatment-related lymphocytosis should not be rated PD and remain on study treatment if other criteria for PD are absent.

c In case of B-lymphoid nodules, assessment is recommended to clarify if the population is clonal. If not, subjects can be assessed as CR/CRi if all other criteria are fulfilled.

Source: {Hallek 2018}.

Table 9. Chronic Lymphocytic Leukemia Disease Response Assessment

Overall Disease Response	Criteria in Table 8	Additional Criteria
CR	All criteria in Group A and B	No disease related symptoms should be present, neutrophil count $\geq 1,500/\mu\text{L}$
CRi	All criteria for CR are met except with platelet count $< 100,000/\mu\text{L}$, hemoglobin $< 11 \text{ g/dL}$, or neutrophil count $< 1,500/\mu\text{L}$	
PR ^a	At least 1 criterion from Group A and 1 from Group B must be fulfilled	If only 1 criterion is abnormal at baseline from Group A or B, only that criterion must improve
SD	Subjects who have not achieved a CR or a PR, and who have not exhibited PD, will be considered to have SD (which is equivalent to a nonresponse)	
PD	Presence of at least 1 of the criteria from Group A or Group B	Constitutional symptoms alone do not define PD. A bone marrow biopsy should be performed to confirm progression if blood count changes are the only evidence of progression.

Abbreviations: CR, complete response; CRi, complete response with incomplete marrow recovery; PD, progressive disease; PR, partial response; SD, stable disease.

^a Nodular PR is defined as a CR/CRi with the presence of nodules of clonal lymphocytes in the bone marrow and will be considered a PR for the purposes of this study.

Source: {[Hallek 2018](#)}.

12.3.2.1. Measurable Residual Disease Response Rate

The measurable residual disease (MRD) response is assessed by evaluation of bone marrow aspirate or peripheral blood with 6-color flow cytometry, allele-specific oligonucleotide polymerase chain reaction (PCR), or high-throughput sequencing. MRD negativity is defined as fewer than 1 CLL cell per 10,000 leukocytes (0.01%) (ie, $< 10^{-4}$). Subjects are defined as MRD negative if their disease burden is below this threshold.

12.4. Protocol Amendment History

A high-level summary of amendment changes are provided in tabular form in the subsection below. Minor changes such as the correction of typographic errors, grammar, or formatting are not detailed.

12.4.1. Amendment 1.0 (dated 20 July 2022)

Changes from the original protocol (dated 23 May 2022) to Amendment 1.0 (dated 20 July 2022) are detailed below.

Section Number and Name	High-level Description of Change	Brief Rationale
Synopsis Number of study sites planned	Number of study sites increased from approximately 40 to 50	To optimize enrolment
Section 6.4.2 Bone marrow aspirate/biopsy	<u>Disease/Response Assessment:</u> For the CLL disease response assessment: <ul style="list-style-type: none"> In subjects who experience disease progression or who achieve a CR of CLL but subsequently relapse, if a bone marrow aspirate (that is clinically indicated in the management of a study treated subject) is acquired, a portion of the aspirate should be sent to the central laboratory if feasible for additional exploratory analyses (refer to the central laboratory manual for details). 	Addition to clarify samples are applicable only for study treated subjects.
Section 6.6 Tumor Biopsy	If a tumor biopsy that is clinically indicated in the management of a study treated subject is acquired, a portion of the biopsy should be sent to the central laboratory for additional exploratory analyses.	Addition to clarify samples are applicable only for study treated subjects.
Section 7.2 Optional bridging therapy	Table 2 ‘Bridging Therapy Regimens’ updated to include details for R-ICE, and R-GEMOX	Added R-ICE and R-GEMOX as optional bridging therapy regimens, in view of subjects that may already have received R-CHOP and DA-EPOCH-R
Section 12.2 Schedule of assessments, Table 5 Schedule of Assessments: Screening, Pretreatment, Treatment, and Post-treatment Periods	Footnotes j and l updated to indicate samples are only applicable for study treated subjects, aligning with language in Sections 6.4.2 and 6.6 described above	Addition to clarify samples are applicable only for study treated subjects
Section 12.2 Schedule of assessments, Table 5 Schedule of Assessments: Screening, Pretreatment, Treatment, and Post-treatment Periods	Removed schedule of a lumbar puncture (if applicable) at suspected Disease Progression	Correction. A lumbar puncture at suspected Disease Progression is not required

Section Number and Name	High-level Description of Change	Brief Rationale
Section 12.2 Schedule of assessments, Table 5 Schedule of Assessments: Screening, Pretreatment, Treatment, and Post-treatment Periods	Added schedule of PROs: EORTC-QLQ-C30 and EQ-5D-5L at Post-bridging therapy assessment (if applicable)	Correction. Added an applicable PROs assessment timepoint.
Section 12.2 Schedule of assessments, Table 6 Post-treatment Follow-up Period	Footnotes e and k updated to indicate samples are only applicable for study treated subjects, aligning with language in Sections 6.4.2 and 6.6 described above	Addition to clarify samples are applicable only for study treated subjects

12.4.2. Amendment 1.1 EU-specific Amendment (dated 12 January 2023)

A high-level summary of this amendment is provided in tabular form in the subsection below. Minor changes such as the correction of typographic errors, grammar, or formatting are not detailed.

For changes from Amendment 1 to Amendment 2, please refer to Section 12.4.2 and Section 12.4.3. Amendment 2 incorporates all changes in Amendment 1.1 together with the changes outlined in Section 12.4.3.

Protocol changes that are common across all substudies are detailed in the Master protocol (Appendix 12.10).

Section Number and Name	High-level Description of Change	Brief Rationale
Title page and Synopsis	EU CT and NCT numbers added	EU CT and NCT numbers previously not available
Synopsis Statistical Methods and Sections 9.1 Hypothesis and 9.4.2 Primary Analysis	<ul style="list-style-type: none"> “significantly” removed from statement that “The hypothesis is that the ORR to brexucabtagene autoleucel per central assessment is significantly greater than 28%.” Text edited to now state that the p-value ‘<u>will</u> be’ calculated based on an exact test, rather than ‘may be’ tested. 	For clarity
Section 3.1 Study Design	Text added to detail that the end of study is defined in the Master protocol (Section 3.4). (Defined as the LPLV within each specific substudy)	For clarity
Synopsis (Eligibility Criteria Unique to the RT Substudy) and Section 4.2.1 RT Substudy-specific Inclusion Criteria	Inclusion criterion 2 updated to (i) allow any first line chemoimmunotherapy, and (ii) Subjects will be eligible regardless of the duration of remission prior to relapse	For clarity

Section Number and Name	High-level Description of Change	Brief Rationale
Section 6.6 Tumor Biopsy	Text updated to state that “a new biopsy is only to be acquired if the location is easily accessible, and if appropriate taking into account subject safety”	Self-explanatory
Section 12.2 Schedule of Assessments Table 5	Pregnancy test added at Day 28	Alignment with CTFG guidelines for pregnancy testing following administration of fludarabine and cyclophosphamide

12.4.3. Amendment 2.0 (dated 01 March 2023)

Changes from Amendment 1.1 (dated 12 January 2023) to Amendment 2 (dated 01 March 2023) are detailed below

Section Number and Name	High-level Description of Change	Brief Rationale
Title Page	Study title updated to read “A Phase 2, Open-Label, Multicenter, Basket Study Evaluating the Efficacy of Brexucabtagene Autoleucel in Adults with Rare B-cell Malignancies (ZUMA-25) – <i>Substudy B – Relapsed/Refractory Richter Transformation</i> ”. The evaluation of safety removed from the study title.	Request during Part 1 EU-CTR application to update the trial title to focus on the primary endpoint only.
Title Page	Amendment history added	Self-explanatory
Section 6.2 Brain Magnetic Resonance Imaging	At screening, CNS involvement will be assessed by local review, and images will not be sent for central review At screening, a brain MRI only needs to be submitted to the independent central reviewer when there is evidence of disease progression	For clarification
Section 12.2 Schedule of Assessments, Table 5 Schedule of Assessments: Screening, Pretreatment, Treatment, and Post-Treatment Periods	Removed requirement for PRO assessment at post-bridging therapy assessment	Correction of typo. The PRO assessment will be at day -5 in all subjects, regardless of bridging therapy
Section 12.2 Schedule of Assessments, Table 5 Schedule of Assessments: Screening, Pretreatment, Treatment, and Post-Treatment Periods	Footnote a: For EU and UK, the subject may remain hospitalized or return to the clinic daily for this extended monitoring, at the discretion of the investigator. For CH, patients must remain hospitalized for 10 days post brexucabtagene autoleucel infusion	Requirement by the Swiss Regulatory Authority

Section Number and Name	High-level Description of Change	Brief Rationale
Section 12.2 Schedule of Assessments, Table 5 Schedule of Assessments: Screening, Pretreatment, Treatment, and Post-treatment Periods	Footnotes ‘o’ pregnancy testing and ‘p’ serology testing updated to include Switzerland	Request by Swiss Regulatory Authority and alignment with Master protocol Section 6
Section 12.2 Schedule of Assessments, Table 5 Schedule of Assessments: Screening, Pretreatment, Treatment, and Post-Treatment Periods	Footnote t: Samples on Day 3 may be collected ± 1 day	Provides flexibility regarding central laboratory sample collection when the Day 3 visit falls over a weekend
Section 12.2 Schedule of Assessments, Table 6 Schedule of Assessments: Post-Treatment Follow-up Period	Window for M18 changed from ± 2 weeks to ± 1 month	Provides added flexibility

12.4.4. Amendment 3.0 (dated 17 August 2023)

Changes from Amendment 2.0 (dated 01 March 2023) to Amendment 3.0 (dated 17 August 2023) are tabulated below.

Section Number and Name	High-level Description of Change	Brief Rationale
General	Correction of typographical errors Removed references to study sites in the UK as UK is no longer participating.	Self-explanatory
Synopsis – Study Design	The evaluation of safety removed from the study title.	Request from EMA reviewer during Part 1 EU-CTR application to update the trial title to focus on the primary endpoint only
Synopsis - – Number of Study Sites Planned	Number of participating sites amended to approximately 25	Number of sites reduced due to early termination of substudies A and D
Synopsis – Statistical Methods	Added language to indicate that study enrollment will be paused following treatment of the 20 th subject with brexucabtagene autoleucel and until data from the interim analyses have been assessed	To allow the Sponsor to review for futility prior to exposing additional subjects to study treatment
Section 3.1 Study Design	Added language to indicate that study enrollment will be paused following treatment of the 20 th subject with brexucabtagene autoleucel and until data from the interim analyses have been assessed	To allow the Sponsor to review for futility prior to exposing additional subjects to study treatment

Section Number and Name	High-level Description of Change	Brief Rationale
Section 6.4.1 Imaging	Added language to specify that to limit radiation exposure, investigators are encouraged to leave at least 4 weeks between consecutive scans	Language added to encourage investigators to limit radiation exposure of subjects
Section 8.1 SRT and DSMB	Added language to indicate that study enrollment will be paused following treatment of the 20 th subject with brexucabtagene autoleucel and until data from the interim analyses have been assessed	To allow the Sponsor to review for futility prior to exposing additional subjects to study treatment
Section 9.4.1 Interim Analysis and Early stopping Guidelines	Added language to indicate that study enrollment will be paused following treatment of the 20 th subject with brexucabtagene autoleucel and until data from the interim analyses have been assessed	To allow the Sponsor to review for futility prior to exposing additional subjects to study treatment
Section 12.2 Schedule of Assessments, Table 5 Schedule of Assessments: Screening, Pretreatment, Treatment, and Post-Treatment Periods	Footnote e- added clarifying text that neurological should be performed every other day during the hospitalization period	To clarify requirements for neurological assessments
Section 12.2 Schedule of Assessments, Table 5 Schedule of Assessments: Screening, Pretreatment, Treatment, and Post-Treatment Periods	Footnote i: added that “To limit radiation exposure, investigators are encouraged to leave at least 4 weeks between consecutive scans”	To limit radiation exposure of subjects
Section 12.2 Schedule of Assessments, Table 6 Schedule of Assessments: Post-Treatment Follow-up Period	Footnote d: added that “To limit radiation exposure, investigators are encouraged to leave at least 4 weeks between consecutive scans”	To limit radiation exposure of subjects
