

**Patient Priorities Care Among Persons Living With Mild Cognitive Impairment and
Dementia (IN-TX-PPC)**

NCT06001775

22 January 2026

Quantitative analysis plan

Demographic characteristics will be compared between the groups of patients with and without a Patient Priorities Care (PPC) conversation documented. Categorical variables, including ethnicity, race, and sex, will be summarized using counts and percentages and compared between groups using Fisher's exact test when appropriate. Age will be analyzed as a continuous variable, summarized using means and standard deviations and compared using the Wilcoxon rank-sum test. The p-values of those tests will be reported. All tests will be two-sided.
