SUMMARY OF CHANGES: CLINICAL STUDY PROTOCOL AMENDMENT 8 (VERSION 9.0)

This version of the Protocol will supersede the previous version (Version 8.0, dated 06 January 2025).

The rationale for this amendment is to include an interim analysis of complete Part A data and available Part B data following the completion of Part A. It has also been clarified that the study plans to randomise up to 49 patients.

The changes to the Protocol are detailed below:

| Section | Description of Change |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Synopsis (Page 16) – Study Design | Previous text: The study plans to randomise 49 patients with a diagnosis of MDD. Amended text: The study plans to randomise <u>up to</u> 49 patients with a diagnosis of MDD. |
| Synopsis (Page 16) – Study Design | Previous text: In Part A, 42 patients are planned to be randomised into two cohorts (minimum 21 patients per cohort). Amended text: In Part A, <u>up to 42</u> patients are planned to be randomised into two cohorts (minimum 21 patients per cohort). |

SYNOPSIS

Study Title: A Two-Part Controlled Clinical Study to Evaluate Safety, Tolerability, Response, Pharmacokinetics and Pharmacodynamics of Single and Multiple Oral Doses of GM-1020 in Patients with Major Depressive Disorder

Investigational Medicinal Product: GM-1020

Clinical Phase: IIa

Objectives:

Part A

The primary objective of Part A of the study is to characterise the safety and tolerability of single oral doses of GM-1020 in patients with major depressive disorder (MDD).

The secondary objectives of Part A of the study are:

- To characterise the efficacy of a single oral dose of GM-1020 in MDD patients.
- To assess the plasma pharmacokinetics (PK) of single oral doses of GM-1020 in MDD patients.
- To characterise the pharmacodynamics (PD) of single oral doses of GM-1020 in MDD patients.

Part B

The primary objective of Part B of the study is to characterise the safety and tolerability of multiple oral doses of GM-1020 in MDD patients.

The secondary objectives of Part B of the study are:

- To assess the plasma PK of multiple oral doses of GM-1020 in MDD patients.
- To characterise the PD of multiple oral doses of GM-1020 in MDD patients.

The exploratory objective of Part B of the study is to characterise the efficacy of two dose levels of multiple oral doses of GM-1020 in MDD patients over a 2 week period.

Endpoints:

Part A

The primary endpoints of Part A of the study are the clinical safety data from adverse event (AE) reporting, 12-lead electrocardiogram (ECG), vital signs (supine blood pressure, heart rate, respiration rate, tympanic temperature), clinical laboratory evaluations (biochemistry, haematology and urinalysis), emergence of suicidal thoughts and ideations (Columbia-Suicide Severity Rating Scale [C-SSRS]) and sedation (Modified Observer's Assessment of Alertness/Sedation [MOAA/S] scale).

The secondary endpoints of Part A of the study are:

- The following efficacy assessments:
 - Structured Interview Guide for the Montgomery-Åsberg Depression Rating Scale (MADRS-SIGMA)
 - Clinical Global Impressions Scale – Improvement (CGI-I)
 - Clinical Global Impressions Scale – Severity (CGI-S)
- Plasma PK concentrations and parameters, including: area under the plasma concentration-time curve (AUC) from time zero to the last quantifiable concentration (AUC_{last}), AUC from zero to infinity (AUC_{inf}), the extrapolated area from AUC_{last} to AUC_{inf} as a % of the total AUC ($AUC_{inf(\%extrap)}$), maximum plasma concentration (C_{max}), metabolite to parent ratio of the AUC corrected by the molecular weight ratio of parent to metabolite (MPR), time to C_{max} (t_{max}), half-life ($t_{1/2}$) and lag-time (time delay between drug administration and first observed concentration above the lower limit of quantification [LLOQ] in plasma [t_{lag}]).

- The following PD assessments:
 - Neurophysiological/neuropsychological test battery:
 - PharmacoeEG (resting-state EEG [rsEEG], auditory steady-state response [ASSR])
 - Somno-Art (wearable device to evaluate sleep architecture)
 - Questionnaires:
 - Clinician-Administered Dissociative States Scale (CADSS)
 - 5-Dimensional Altered States of Consciousness Rating Scale (5D-ASC)
 - 11-Dimensional Altered States of Consciousness (11D-ASC) scoring also will be obtained from the answers to the 5D-ASC
 - Drug Effects Questionnaire (DEQ)
 - Patient Health Questionnaire-9 (PHQ-9)
 - Sheehan Disability Scale (SDS)
 - Continuous Passive Behavioural Assessment
 - Reward Functioning

Part B

The primary endpoints of Part B of the study are the clinical safety data from AE reporting, 12 lead ECG, vital signs (supine blood pressure, heart rate, respiration rate, tympanic temperature), clinical laboratory evaluations (biochemistry, haematology and urinalysis), emergence of suicidal thoughts and ideations (C-SSRS) and sedation (MOAA/S).

The secondary endpoints of Part B of the study are:

- Plasma PK concentrations and parameters, including: AUC_{last} , AUC_{inf} , $AUC_{inf(\%extrap)}$, C_{max} , MPR, t_{max} , $t_{1/2}$ and t_{lag} .
- The following PD assessments:
 - Neurophysiological/neuropsychological test battery:
 - PharmacoeEG (rsEEG, ASSR)
 - Somno-Art
 - Questionnaires:
 - CADSS
 - 5D-ASC
 - 11D-ASC (obtained from 5D-ASC answers)
 - DEQ
 - Face Emotion Recognition Task (FERT)
 - Reward Functioning
 - Continuous Passive Behavioural Assessment

The exploratory endpoints of Part B of the study are the following efficacy endpoints:

- MADRS-SIGMA
- CGI-I
- CGI-S
- PHQ-9
- SDS
- EuroQol 5 Dimension 5 Level (EQ-5D-5L) Quality of Life Scale

Study Design:

Part A of this study is a randomised, double-blind, placebo-controlled, 2-period, crossover study to assess a single oral dose level (140 mg) of GM-1020 in male and female patients with a diagnosis of MDD. Part B of the study is a randomised, double-blind extension phase to evaluate twice-weekly administration of two oral dose levels of GM-1020 for 2 weeks in male and female patients with a diagnosis of MDD.

The study plans to randomise up to 49 patients with a diagnosis of MDD. For the purposes of this Protocol, a randomised patient is defined as one who has been randomised in the study and received the first dose of study drug on Day 1. In the event of patient withdrawal or drop-out from the study (for non-safety reasons only), the Sponsor reserves the right to replace any randomised patient that receives the study treatment in either crossover period of Part A. Patients will take part in both Part A and Part B. In Part A, up to 49 patients are planned to be randomised into two cohorts (minimum 21 patients per cohort). Both cohorts will take part in two treatment periods, in which they will receive either a single dose of GM-1020 (140 mg) or a single dose of placebo in each treatment period. Overall, all patients will receive a single dose of 140 mg GM-1020 and a single dose of placebo in Part A of the study.

Patients will be required to attend the Clinical Research Unit (CRU) for a Screening visit up to 42 days prior to first dosing to ensure they meet the inclusion/exclusion criteria and are in good general health. A SAFER interview will also be conducted during the Screening period by an independent interviewer via telephone. Patients will attend a virtual visit 1 day prior to first dosing (Day -1) for the collection of baseline PD and efficacy assessments. Patients will attend the CRU in the morning of Day 1 for Treatment Period 1, in which they will receive a single oral dose of either 140 mg GM-1020 or placebo following collection of predose safety, PK and PD assessments. Randomisation (for both Part A and Part B) will take place prior to first dosing on Day 1. Patients will be randomised to one of four treatment sequences to assign both Part A treatment sequence (i.e., 140 mg GM-1020 → Placebo, or Placebo → 140 mg GM-1020) and Part B dose level (i.e., 140 mg GM-1020 or 210 mg GM-1020). Patients will remain in the CRU until completion of the postdose safety, PK and PD assessments (minimum of 8 hours postdose) and will be discharged from the CRU on Day 1 at the discretion of the Investigator.

A virtual post-treatment visit will be conducted on Day 2. During a 14-day (± 1 day) washout period, patients will return to the CRU on Day 4 for an outpatient visit and will attend a virtual visit on Day 8 and Day 11. During this period, patients will be passively monitored with smartphone technology capable of inferring the trajectory toward relapse of depressive symptoms remotely.

Patients will attend a virtual visit 1 day prior to the second dosing (Day 14) for the collection of baseline PD and efficacy assessments. Following a washout period of 14 days (± 1 day), patients will attend the CRU on Day 15 for Treatment Period 2 to receive a single oral dose of the alternative treatment (either 140 mg GM-1020 or placebo, whichever was not previously administered) following collection of predose safety, PK and PD assessments. As in Treatment Period 1, patients will remain in the CRU until completion of the postdose safety, PK and PD assessments (minimum of 8 hours postdose) and will be discharged from the CRU on Day 15 at the discretion of the Investigator. The assessments conducted in Treatment Period 1 and Treatment Period 2 will be the same.

A virtual post-treatment visit will be conducted on Day 16. During a second 14-day (± 1 day) washout period, patients will return to the CRU on Day 18 for an outpatient visit and will attend a virtual visit on Day 22, Day 25 and Day 28. During this period, patients will be passively monitored with smartphone technology capable of inferring the trajectory toward relapse of depressive symptoms remotely.

Following the second washout period, patients will attend a Part A Follow-up visit on Day 29 ($-1/+7$ days). During this visit, patients will receive their first administration of one of two dose levels of GM-1020 (140 mg or 210 mg), which will be administered twice-weekly for a period of 2 weeks. This will be Part B of the study. The second dose level (210 mg), not administered in Part A of the study, has been chosen based on the safety, tolerability, PK and PD of GM-1020 in the Phase I single ascending dose (SAD) trial. Patients will be administered their first Part B dose during this visit (Day 29 [$-1/+7$ days]) and will remain in the CRU until completion of the postdose safety, PK and PD assessments (minimum of 8 hours postdose) before being discharged from the CRU, at the discretion of the Investigator.

Patients will return to the CRU for outpatient visits on Day 32 (± 2 days), Day 36 (± 2 days) and Day 39 (± 2 days), during which they will be administered a dose of GM-1020, and will attend post-treatment visits on Day 30 (± 2 days; virtual), Day 33 (± 2 days; virtual), Day 37 (± 2 days; virtual), Day 40 (± 2 days; in-clinic) and Day 42 (± 2 days; virtual). Part B dosing days (Day 29, Day 32, Day 36 and Day 39) have windows to aid scheduling of patients. The minimum interval required between doses is 48 hours, and the post-treatment visits (Day 30, Day 33, Day 37 and Day 40) must always occur the day after the respective dosing.

The Part B Follow-up visit on Day 67 (± 2 days) will conclude the patients' participation in the study. The maximum duration of participation for each patient is expected to be approximately 16 weeks.

Treatment Duration:

Part A: 2 days (Day 1 and Day 15).

Part B: Twice-weekly for 2 weeks (Day 29, Day 32, Day 36 and Day 39).

Study Participants:

Generally healthy male and female participants with a diagnosis of recurrent MDD, aged between 18 to 65 years (inclusive), with a body mass index of 18.0 to 35.0 kg/m² (inclusive). Additionally, patients must meet the following criteria:

- Patient meets the Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition (DSM-5) diagnostic criteria for recurrent MDD without psychotic features based on the Mini-International Neuropsychiatric Interview (MINI) at Screening.
- Patient currently has moderate to severe MDD as confirmed with a MADRS-SIGMA total score >22 and CGI-S score >3 at Screening and Day -1.
- Patient is either not currently taking antidepressants (and hasn't for at least 6 weeks prior to Screening) or is being treated with an antidepressant drug according to national guidelines during the current MDD episode.
 - If the patient is currently being treated with antidepressants, these have been prescribed at a stable dose and the dose has remained unchanged for at least 6 weeks prior to Screening.
- Changes in current drug treatment or psychological treatment for depression are not foreseen for the duration of the study.

Dose and Route of Administration:

In Part A of the study, patients will be administered a single oral dose of either 140 mg GM-1020 or placebo on Day 1. Following a washout period of 14 days (± 1 day), patients will be administered a single oral dose of the alternative treatment (either 140 mg GM-1020 or placebo, whichever was not previously administered) on Day 15.

In Part B of the study, patients will be administered one of two dose levels of GM-1020 (140 mg or 210 mg) twice-weekly for a period of 2 weeks.

Criteria for Evaluation:

Safety will be assessed through AE reporting, vital signs, clinical laboratory evaluations data, physical examinations, 12-lead ECG, the C-SSRS and the MOAA/S. Blood samples will be collected for assessment of PK.

Pharmacodynamics will be assessed through the following assessments:

- Neurophysiological/neuropsychological test battery:
 - PharmacoeEG (rsEEG, ASSR)
 - Somno-Art
- Questionnaires:
 - CADSS
 - 5D-ASC
 - 11D-ASC (obtained from 5D-ASC answers)
 - DEQ
- PHQ-9 (Part A only)
- SDS (Part A only)
- FERT (Part B only)
- Reward Functioning
- Continuous Passive Behavioural Assessment

Efficacy will be assessed through the following assessments:

- MADRS-SIGMA
- CGI-I
- CGI-S
- PHQ-9 (Part B only)
- SDS (Part B only)
- EQ-5D-5L (Part B only)

Statistical Analysis:

All safety, tolerability, PK, PD and efficacy variables will be summarised using descriptive statistics. Descriptive statistics for categorical variables will include frequency and percentage. Descriptive statistics for continuous variables will include number of patients (n), mean, standard deviation, median, minimum and maximum. Summaries of change from baseline variables will include only patients who have both a baseline value and corresponding value at the timepoint of interest. Separate summaries will be presented for each part of the study.
