3.0 SYNOPSIS OF STUDY DESIGN

3.1 Purpose of Statistical Analysis Plan

This statistical analysis plan is intended to provide a detailed and comprehensive description of the planned methodology and analysis to be used for the "Automated assessment of pulmonary vein isolation (PVI) using a novel electrophysiology (EP) procedure recording system (CathVision Cube® System)" clinical investigation. This plan is based on the CPVI-002 Clinical Investigation Plan.

3.2 Clinical Investigation Objectives

The main objective in this study is to evaluate the performance of automated PVI Analyzer software with the CathVision Cube® system in radiofrequency (RF), cryo-balloon and pulsed-field ablation (PFA) procedures.

The primary objective of the study is to validate the PVI Analyzer software with a novel EP recording system (CathVision Cube® System) for assisting assessment of isolation status following PVI ablation, while the secondary objectives include the assessment of the accuracy of automated PVI Analyzer classification of pulmonary vein isolation procedures, the determination of the feasibility of "real-time" assessment of PVI analysis, and the assessment of rhythm-dependent performance using the PVI Analyzer and CathVision Cube® System, among other analyses.

3.3 Clinical Investigation Design

The PVISION clinical study is a prospective, multi-center study with the CathVision Cube® system and the PVI Analyzer software in pulmonary vein isolation procedures.

The study population is expected to be up to 120 subjects, distributed in three different procedures: RF, cryo-balloon and PFA.

Up to 30 subjects will be enrolled for PFA,

3.4 Endpoints

3.4.1 Primary endpoint

The primary performance endpoint is to validate the PVI Analyzer analysis software with a novel EP recording system (CathVision Cube® System) for assessment of isolation status following PVI ablation. The overall performance of pulmonary vein (PV) isolation classification shall be superior to a specified level of performance.

 Automated PVI Analyzer classification of PV isolation in sinus rhythm (SR) during PVI ablation treatment with a specificity and sensitivity both superior to 80%.

3.4.2 Safety endpoint

The safety endpoint of the Study is to evaluate the adverse events (AEs) and/or device deficiencies reported with the use of the CathVision Cube® System.

it is expected that AEs related to the device

and device deficiencies will be minimal or absent.

3.4.3 Secondary performance endpoints

The secondary performance endpoints have been established to determine the feasibility of time-critical assessment of PVI analysis and rhythm-dependent performance using the PVI Analyzer software with the CathVision Cube® System through the following items:

- Accuracy of automated PVI Analyzer classification of PV isolation in SR during PVI Cryo-balloon ablation
- 2. Accuracy of automated PVI Analyzer classification of PV isolation in SR during RF ablation
- 3. Assessment of automated PVI Analyzer classification of PV isolation in SR after PFA
- 4. Feasibility of continuous "real-time" assessment of isolation
- 5. Feasibility of assessment of isolation during AF rhythm
- Feasibility of assessment of isolation at time of expert-defined isolation before the end of the ablation procedure
- Comparison of device performance on same data recorded by CathVision Cube and Boston Scientific LSPro

3.5 Randomization and blinding

Randomization and blinding are not applicable to this study,

[&]quot;Classification" in secondary performance endpoints also follows the definition described for the primary endpoint.

4.0 ANALYSIS CONSIDERATIONS

Enrolled population includes up to 120 patients fulfilling all inclusion criteria,

4.1 Analysis Populations

If any be en	of the exclusion criteria are met, the patient is excluded from the clinical investigation and cannor rolled.
4.1.1	Intent-to-treat population (ITT)
4.1.2	Per-protocol treatment (PPT)
4.2	Data Processing

Statistical Methods 4.3

Descriptive statistics for continuous variables

Continuous variables (e.g., age, beats per minute (BPM), etc.), will be summarized using standard quantitative statistics: number of non-missing observations, mean, standard deviation, median, quartiles and range (minimum and maximum observed values), with 95% confidence intervals (CI) where specified in the table mockups. The number of missing observations, if any, will also be summarized.

4.3.2 Descriptive statistics for categorical variables

For categorical variables (e.g., gender, diabetic status, etc.), results will be summarized using classical frequency statistics: number of non-missing observations and percentages/rates by categories, and where specified in the table mockups, with exact 95% Clopper-Pearson CI.

4.4 Endpoint Analysis

The primary performance endpoint for this investigation is to validate the PVI Analyzer analysis software with a novel EP recording system (CathVision Cube® System) for assessment of isolation status following PVI ablation The performance is evaluated separately for specificity and sensitivity:	4.4.1 Primary endpoint	
The performance is evaluated separately for specificity and sensitivity;	software with a novel EP recording system (CathVision Cube® System) for assessment of isola	
	The performance is evaluated separately for specificity and sensitivity;	
		1

a clinically relevant lower limit o
erformance has been established and defined as 80% specificity and 80% sensitivity.
4.2 Safety endpoint
he safety endpoint of the study will evaluate the AEs and/or device deficiencies reported with the use
the CathVision Cube® System
4.3 Secondary endpoints
he secondary performance endpoints will determine the feasibility of time-critical assessment of PV

The secondary performance endpoints will determine the feasibility of time-critical assessment of PVI analysis and rhythm-dependent performance using the PVI Analyzer software with the CathVision Cube® System.

- Accuracy of automated PVI Analyzer classification of PV isolation in SR during Cryo-balloon ablation.
- Accuracy of automated PVI Analyzer classification of PV isolation in SR during RF ablation.

•	Assessment of automated PVI Analyzer classification of PV isolation in SR after PFA.
	A to see to LDM A color of the city of DM in the city NOD
•	Automated PVI Analyzer classification of PV isolation in NSR.
•	Feasibility of "real-time" assessment of isolation.
•	PVI Analyzer classification accuracy at the time of expert-defined isolation.
•	Comparison of device performance with conventional system.
.5	Sample Size Calculations
	ample size calculation is based on the primary performance endpoint to demonstrate that the PVI zer software is superior to clinically relevant performance level, as established by prior
-	cations.

a maximum of 90 subjects will be required.
A cohort of 30 subjects undergoing PFA will be added to the study, and this additional data will be analyzed posteriorly. This PFA cohort does not relate to the primary endpoint and therefore does not affect the primary endpoint analysis nor the sample size calculation.
4.6
4.7 Timing of Analysis
4.8 Study Success
4.9

4.10 Handling of Missing Data

Missing data will be counted and summarized in the descriptive analysis for continuous and categorical variables.

Missing data will not be replaced or imputed.

4.11			
4.12			

5.0 <u>DESCRIPTIVE ENDPOINTS AND ADDITIONAL DATA</u>

5.1 Baseline and Demographic Characteristics

The following baseline and demographic variables will be summarized for the subjects enrolled: gender, age, atrial fibrillation and cardiovascular history, cardiac medications, implant procedural characteristics, etc.

5.2 Adverse Events

All of the adverse device effects (ADEs), serious adverse device effects (SADEs), unanticipated adverse device effects (UADEs), and unanticipated serious adverse device effects (USADEs) will be summarized for all subjects who are enrolled in this study,

5.3 Subject Early Termination

Reasons for premature study discontinuation will be collected and summarized when provided or available.

5.4 Protocol Deviation

All protocol deviations, including reasons and associated visit, will be categorized and summarized.

5.5 Number of Subject Imbalance

All efforts will be made to maintain a balanced enrollment among the 4 study centers and among RF and cryo-balloon procedures. A maximum of 25 subjects for RF and 25 subjects for cryo-balloon is set per site. Similarly, balanced enrollment will be attempted for the additional 30 PFA subjects, with a maximum of 15 subjects enrolled per site.

Abbreviations: CIP: clinical investigation plan; n: counts; N: total; %: percentage

Table 16. Overview of adverse events by severity

Parameter		Number of events	Number of subjects	Rate per subject (n/N, %) N=XX
Adverse Event (A	E) reported			
Severity of AE	Mild			
	Moderate			
	Severe			

Abbreviations: AE: adverse event.

Table 17. Adverse events by relation to the study

Parameter	Relationship	Number of events	Number of subjects	Rate per subject (n/N, %) N=XX
AE relationship to	Device related			
the study	Procedure related			
	Other			

Abbreviations: AE: adverse event.

Table 18. Overview of serious adverse events

Parameter	Number of events	Number of subjects	Rate per subject (n/N, %) N=XX
Any Serious Adverse Event (SAE)			

Abbreviations: N: total subjects; n: counts

Table 19. Classification of SAEs

Classification of SAEs	Number of events	Number of subjects	Rate per subject (n/N, %) N=XX
Led to death			
Led to fetal distress, fetal death or a congenital abnormality or birth defect			
Resulted in a life-threatening illness or injury			
Resulted in a permanent impairment of a body structure or a body function			
Resulted in a patient hospitalization or prolonged an existing hospitalization			
Resulted in a medical or surgical intervention to prevent life-threatening illness or injury or permanent impairment to a body structure or a body function			

Abbreviations: N: total subjects; n: counts

Table 20. Overview of serious adverse device effects (SADEs)

Parameter	Number of events	Number of subjects	Rate per subject (n/N, %) N=XX
Serious adverse device effect (SADE) incidence			

Abbreviations: N: total subjects; n: counts

Table 21. Overview of unanticipated serious adverse device effects (USADEs)

Parameter	Number of events	Number of subjects	Rate per subject (n/N, %) N=XX
Serious unanticipated serious adverse device effect (USADE) incidence			

Abbreviations: N: total subjects; n: counts

Table 23. Overview of device deficiencies

Parameter	Number of events	Number of subjects	Rate per subject (n/N, %) N=XX
Device deficiency incidence			

Abbreviations: N: total subjects; n: counts
