

**Train-of-four monitoring using the TetraGraph Neuromuscular
Transmission Monitor to evaluate rocuronium infusion
requirements during major neurosurgical and surgical procedures.**

NCT06472284

September 13, 2024

Statistical Analysis: Descriptive statistics were used to summarize baseline demographic and clinical characteristics of the study population. Categorical variables were presented as frequencies and percentages, while continuous variables were summarized using medians and interquartile ranges (25th and 75th percentiles), based on non-normal distributions assessed using the Shapiro Wilk test. All analyses were conducted using Stata version 18 (StataCorp, College Station, TX).
