

Statistical Analysis Plan (SAP)

Official Study Title:
**Comparison of Vicryl Versus Prolene for Midline
Rectus Sheath Closure After Elective Laparotomy**

Brief Title:
Comparison of Vicryl Versus Prolene for Midline Rectus Sheath Closure

ClinicalTrials.gov Identifier
NCT Number: *Not yet assigned*

Unique Protocol ID
HMC-RECTUS-2019

Study Type
Randomized Controlled Trial (RCT)

Study Sponsor / Conducting Institution
Hayatabad Medical Complex (HMC)
Peshawar, Pakistan

Study Document
Statistical Analysis Plan (SAP)

Responsible party: Dr. Gohar ali

Principal Investigator:
Dr. Gohar Ali
Principal Investigator
Department of Surgery
Hayatabad Medical Complex, Peshawar, Pakistan

Ethics Approval:
Approved by Ethical Committee, Hayatabad Medical Complex, Peshawar
Approval Number: HMC-QAD-F No. IREB- 1680

Document date: May 05, 2024.

Statistical Analysis Plan (SAP)

Official Study Title:

Comparison of Vicryl Versus Prolene for Midline Rectus Sheath Closure After Elective Laparotomy

1. Introduction

This SAP outlines the statistical methods that will be used to analyze data from the study comparing polyglactin 910 (Vicryl®) and polypropylene (Prolene®) sutures for midline rectus sheath closure in elective laparotomy patients. The plan covers analysis of primary and secondary outcomes, handling of missing data, and interpretation of results.

2. Objectives and Outcomes

Primary Objective:

- Compare the incidence of Surgical site Infections (SSI) between Vicryl and Prolene groups within 30 days postoperatively.

Secondary Objectives:

- Compare rates of Wound dehiscence.
- Compare postoperative pain scores (VAS scale).
- Assess incidence of incisional hernia within 30 days.

Primary Outcome:

- Wound Infections (Yes/No) within 30 days postoperatively.

Secondary Outcomes:

- Wound dehiscence (Yes/No) within 30 days.
- Postoperative pain score (VAS 0–10) at 24h, 48h, 7 days, and 30 days.
- Incisional hernia (Yes/No) within 30 days.

3. Sample Size Calculation

Assumptions:

Expected wound SSI and wound dehiscence rate: Vicryl 15%, Prolene 5% (based on prior literature).

α (two-sided) = 0.05

Power = 80%

Formula for comparing two proportions:

$$n = \frac{(Z_{1-\alpha/2} \sqrt{2P(1-P)} + Z_{1-\beta} \sqrt{P_1(1-P_1) + P_2(1-P_2)})^2}{(P_1 - P_2)^2}$$

Calculated Sample Size:

164 participants total (82 per group)

Adjusted for 20% dropout: 200 participants (100 per group)

4. Statistical Methods

4.1 General Approach

Data will be analyzed using SPSS v26.

Descriptive statistics will summarize baseline characteristics:

Continuous variables: mean \pm SD (if normally distributed) or median [IQR] (if skewed).

Categorical variables: frequency (%)

4.2 Analysis of Primary Outcome

Outcome: Wound dehiscence (binary)

Method: Chi-square test or Fisher's exact test (if expected cell counts <5)

Effect measure: Risk difference and relative risk with 95% CI

4.3 Analysis of Secondary Outcomes

SSI (binary): Chi-square test; risk difference and 95% CI

Postoperative pain (continuous, VAS):

Repeated measures ANOVA or mixed-effects model for 24h, 48h, 7-day, 30-day scores

Post-hoc pairwise comparisons with Bonferroni correction

Incisional hernia (binary): Chi-square test; 95% CI

4.4 Handling Missing Data

Missing primary outcome data will be minimized via complete follow-up.

If $<5\%$ missing, complete-case analysis will be used.

If $>5\%$ missing, multiple imputation may be considered.

4.5 Subgroup Analysis

Age (<50 vs ≥ 50), sex (male vs female), BMI (<25 vs ≥ 25)

Interaction between suture type and subgroup assessed using logistic regression

4.6 Significance Level

Two-sided p-value <0.05 considered statistically significant.

5. Data Presentation

Tables: Baseline characteristics, primary and secondary outcomes, subgroup analyses

Figures: Bar charts for SSI and wound dehiscence rates; line graph for VAS pain scores over time

6. Software

- SPSS version 26 for statistical analysis
- Microsoft Excel for graphical presentation.
