FIGURE1 TRIAL FLOW CHART.....	10
-------------------------------	----

1. Study Overview

1.1. Study Objective

To evaluate the safety and efficacy of the scoring balloon catheter manufactured by Sino Medical Sciences Technology Inc. for the treatment of coronary artery stenotic lesions.

1.2. Indications

Scoring balloon catheter are employed to treat coronary artery stenosis, including in-stent restenosis and complex C-type lesions, thereby improving myocardial perfusion.

1.3. Study Design

This prospective, multicentre, randomised, parallel-group, non-inferiority trial design evaluated the safety and efficacy of the scoring balloon catheter. The trial planned to enrol 136 patients with coronary artery stenotic lesions. Following the signing of informed consent forms, all subjects underwent coronary angiography after investigators determined compliance with patient-related inclusion criteria and absence of patient-related exclusion criteria. If the angiographic findings met the inclusion criteria and excluded the exclusion criteria, subjects were randomly assigned to either the trial group or the control group (with a 50% probability of allocation to each group) for balloon dilatation of the lesion. Subjects in the trial group received balloon dilatation using the scoring balloon catheter developed by Sino Medical Sciences Technology Inc. Subjects in the control group received balloon dilatation using the NSE Coronary Dilatation Catheter (National Medical Device Import Registration No. 20163035067) developed by Goldman Co., Ltd.

Follow-up time points during this trial included pre-PCI, intra-procedural, and post-procedural follow-up until discharge. The primary endpoint was device success rate (by lesion level), with secondary endpoints comprising procedural success rate (by patient level). Concurrent safety endpoints comprised the composite target lesion failure (TLF) rate from procedure initiation to discharge and its constituent events, patient-oriented composite endpoints (PoCE) and its constituent event rates, alongside other procedure-related adverse events and serious adverse events (e.g., balloon rupture, vascular dissection, in-stent thrombosis), and device deficiency.

1.4. Trial flowchart

Item Timepoint	Screening Period	Treatment Period	Follow-up Period
	Preoperative (D-14 to D-0)	Surgical Procedure (D 0)	Postoperative to Pre- Discharge
Signing of informed consent form	▲

Electrocardiogram ⁵	▲		▲ (Within 48 hours post-procedure)
Inclusion/Exclusion Criteria	▲		
Centralised randomisation	▲		
Clinical Evaluation		▲	
Coronary angiography ⁶		▲	
Coagulation Function ⁷	▲		
Cardiovascular adverse events ⁸		▲	▲
Adverse events and serious adverse events		▲	▲
Device deficiency		▲	
Cardiovascular concomitant medications	▲	▲	▲

Notes:
 1) Vital signs: systolic blood pressure, diastolic blood pressure, and heart rate.
 2) Pregnancy test: Applicable only to women of childbearing age.
 3) To safeguard the rights of trial participants, blood count and biochemical test results obtained within one month prior to operative shall be accepted (where multiple tests exist, the most recent result shall prevail): □ Blood count: White blood cell count (WBC), red blood cell count (RBC), platelet count (PLT), haemoglobin (HB); □ Renal function: Serum creatinine (SCr); □ Liver function: Alanine aminotransferase (ALT), Aspartate aminotransferase (AST); ④ Lipid profile: Triglycerides (TG), Total cholesterol (TC), High-density lipoprotein cholesterol (HDL-C), Low-density lipoprotein cholesterol (LDL-C).
 4) Cardiac enzyme panel: Creatine kinase (CK), Creatine kinase MB isoenzyme (CK-MB), Cardiac troponin T (cTnT)/Cardiac troponin I (cTnI) (either one may be selected; both are not required). Note: Postoperative cardiac enzyme panel should be completed within 48 hours post-procedure. Should results be abnormal and clinically significant, repeat testing is required prior to discharge.
 5) Postprocedure electrocardiogram (ECG) should be performed within 48 hours postprocedurally.
 6) Coronary angiography shall be performed immediately postprocedurally at each centre and recorded onto optical disc.

Item Timepoint	Screening Period	Treatment Period	Follow-up Period
	Preoperative (D-14 to D-0)	Surgical Procedure (D 0)	Postoperative to Pre-Discharge
7)	Coagulation function includes prothrombin time (PT), activated partial thromboplastin time (APTT), thrombin time (TT), and fibrinogen (FIB). To safeguard subject rights, results from tests conducted within one month prior to procedure will be accepted.		
8)	Cardiovascular adverse events comprise major adverse cardiac events (MACE: including all-cause mortality, myocardial infarction [MI], and target lesion revascularisation [TLR]), target lesion failure (TLF, comprising cardiac death, target vessel myocardial infarction [TV-MI], and clinically-indicated target lesion revascularisation [CI-TLR]), and patient-oriented composite endpoints (PoCE, encompassing all-cause mortality, all myocardial infarctions, and all revascularisation events [target lesion revascularisation (TLR), target vessel non-target lesion revascularisation [TVR], and non-target vessel revascularisation).		

Figure1 Trial flow chart

1.5. Sample size

Based on literature review, clinical experience, and results from studies evaluating scoring balloon catheters for coronary artery disease, it is hypothesised that the study group's Sino scoring balloon dilation catheter will demonstrate comparable efficacy to the control group's Goodman coronary NSE balloon catheter, with an anticipated device success rate of 96%. Considering factors such as operator skill variation, lesion complexity, and subject comorbidities and disease severity, the sponsor, clinical experts, investigators, and statisticians jointly determined a non-inferiority margin Δ of -10%, a one-sided test α of 0.025, and a test power (1- β) of 0.8. PASS software calculations yielded a total sample size of 122 subjects, with 61 subjects in each group. Accounting for a 10% dropout rate, the trial requires 136 subjects, distributed as 68 in each group. The sample size calculation formula is as follows:

$$n_T = n_C = \frac{\left(Z_{1-\frac{\alpha}{2}} + Z_{1-\beta}\right)^2 [P_C(1 - P_C) + P_T(1 - P_T)]}{(|D| - \Delta)^2}$$

Where n_T and n_C denote the sample sizes for the treatment and control groups respectively, $Z_{1-\frac{\alpha}{2}}$ and $Z_{1-\beta}$ represent the quantiles of the standard normal distribution, P_T and P_C denote the expected event rates for the treatment and control groups respectively, $|D| = |P_T - P_C|$ denotes the absolute difference in expected rates between the two groups, and Δ denotes the non-inferiority margin, taken as a negative value.

This trial will be conducted concurrently across multiple clinical trial sites. In principle, enrolment numbers will be distributed as evenly as possible among centres to ensure adequate representativeness. However, considering feasibility and enrolment progress, adjustments to enrolment quotas for participating sites will be made based on actual circumstances, striving to maintain balanced enrolment scales across centres. The final enrolment size for any single centre shall not exceed 50% of the total number of cases.

2. Evaluation Criteria

2.1. Efficacy Evaluation

2.1.1. Primary efficacy endpoint

The primary efficacy endpoint of this clinical trial is the device procedural success rate (by lesion level).

Device usage success (by lesion level) requires simultaneous fulfilment of the following conditions:

- a. The balloon must successfully complete the entire balloon dilatation procedure, including delivery, passage through the lesion, inflation, deflation, and withdrawal;
- b. Immediate post-PCI residual stenosis at the target lesion $\leq 30\%$ (post-PCI residual stenosis for ISR and drug-coated balloon restenosis lesions $< 50\%$).

2.1.2. Secondary efficacy endpoint

The secondary efficacy endpoint of this clinical trial is procedural success rate (by subject level).

Achieving procedural success (by the subject level) requires simultaneous fulfilment of the following conditions:

- a. At least one target lesion demonstrates immediate post-PCI residual stenosis $\leq 30\%$ (for ISR and drug-eluting balloon restenosis lesions, residual stenosis $< 50\%$);
- b. Absence of major adverse cardiac events (MACE) during the postprocedure hospital stay: all-cause mortality, myocardial infarction (MI), and target lesion revascularisation (TLR).

2.2. Safety Evaluation

1) Target lesion failure composite endpoint (TLF) incidence

Any of the following events constituted a TLF:

- a. Cardiovascular death (including cases where the cause of death is uncertain but considered cardiovascular in origin);
- b. Target Vessel-Related Myocardial Infarction (TV-MI);
- c. Clinically-indicated target lesion revascularisation (CI-TLR).

Evaluation method: The observation period spans from the commencement of procedure until discharge. For each subject, the incidence rates of individual events and the composite event rate are calculated.

2) Incidence of the patient-oriented composite endpoint (PoCE)

Any occurrence of the following events constituted a PoCE:

- a. All-cause mortality;
- b. All myocardial infarctions;
- c. All recurrent revascularisation events, including target lesion revascularisation (TLR), target vessel non-target lesion revascularisation (TVR), and non-target vessel revascularisation.

Evaluation method: The observation period spans from the commencement of procedure until discharge. For each subject, the incidence rate of individual events and the composite event rate shall be separately calculated.

3) Incidence of Individual Adverse Events and Serious Adverse Events

Evaluation Method: The observation period spans from the commencement of procedure until discharge. Other potential adverse events include balloon rupture, vascular perforation, dissection, acute occlusion, vasospasm, thrombosis (including in-stent thrombosis), and arrhythmias requiring intervention. The incidence rate of each individual event shall be separately calculated.

4) Incidence of device deficiency

3. Analysis Data Set

Full Analysis Set (FAS): The population defined according to the intention-to-treat principle, comprising all subjects who were randomised and received the study product. For patients with missing primary efficacy endpoint data, worst observation carried forward (WOCF) was applied.

Per-protocol set (PPS): Subgroup of the completed trial population excluding major protocol deviations (e.g., subjects breaching inclusion or exclusion criteria).

Safety Set (SS): Refers to the dataset comprising subjects who used the investigational device and for whom safety endpoints were recorded.

Efficacy analyses will be conducted based on both the full analysis set and the per-protocol set. All baseline demographic analyses utilise data from the full analysis set, while safety evaluations employ the safety set.

4. Handling of missing data

For patients in the FAS who did not have an observation for the primary efficacy endpoint, worst observation carried forward was applied. For target lesions where device success could not be determined, imputation was performed as 'device failure'. No imputation was performed for secondary endpoints or efficacy endpoint in the PPS. Missing safety data were not imputed.

5. Statistical Analysis Methods

5.1. General Principles

Data description and analysis were performed using SAS software. All statistical tests employed two-sided significance testing (unless otherwise specified). Confidence intervals were calculated at the 95% confidence level.

1) Statistical Description: Quantitative indicators were described by calculating mean, standard deviation, median, minimum, maximum, lower quartile (Q1), and upper quartile (Q3). Categorical indicators were described by number and percentage of cases in each category. Grading indicators were described by number and percentage of cases in each grade.

2) Statistical inference: Comparisons between two groups will employ appropriate methods based on the nature of the indicator. For quantitative indicators, inter-group comparisons will utilise paired t-tests (assuming equal variance and normal distribution) or Wilcoxon signed-rank tests, depending on data distribution. Categorical indicators will be analysed using chi-square tests or exact probability methods (where chi-square is inappropriate). Ordinal data will be assessed via Wilcoxon signed-rank tests or the Mann-Whitney U test.

5.2. Subject Distribution and Trial Completion Status

Summarise screening, enrolment, and completion numbers per centre, listing dropout cases. Provide detailed tables comparing dataset sizes across groups, case distribution per centre, overall dropout rates, reasons for screening failure, and reasons for non-completion.

5.3. Demographic data and baseline analysis

Describe patient demographics (age, gender, etc.), relevant medical history, and treatment history. Compare characteristics such as age and gender between groups to assess comparability. Demographic analysis is based on the FAS analysis set.

5.4. Efficacy Analysis

5.4.1. Primary Efficacy Endpoints

Primary efficacy evaluation is based on the Full Analysis Set (FAS) and the Per-Protocol Set (PPS).

This trial employs a multicentre, randomised, parallel-group, non-inferiority design. The primary efficacy endpoint is device procedural success rate (by lesion level), with the following hypothesis testing:

$$H_0 : p_T - p_C \leq -\Delta$$

$$H_1 : p_T - p_C > -\Delta$$

In the formula, $p_{(T)}$ denotes the device usage success rate for the experimental group, p_C represents the device usage success rate for the control group, and $-\Delta$ signifies the non-inferiority margin, set at -10%.

At $\alpha=0.025$ (one-sided test) and $\beta=0.2$, the device procedural success rate (by lesion level) of the experimental group is compared with that of the control group. The difference in device procedural success rates (by lesion level) between the two groups is calculated, along with the 95% confidence interval for this difference. Based on the lower limit of the confidence interval, a judgement is made as to whether the non-inferiority criterion has been met. If the lower limit of the 95% confidence interval is not less than -10%, the conclusion of non-inferiority is established. Should centre effects require consideration, the CMH chi-square test shall be employed.

5.4.2. Secondary efficacy endpoints

Secondary efficacy assessments were based on the full analysis set (FAS) and the per-protocol set (PPS).

Surgical success rates at the subject level are statistically analysed according to categorical indicators and compared between groups.

5.5. Safety analysis

The composite endpoint of target lesion failure at the lesion level from procedure initiation to pre-discharge, along with the incidence rates of individual events, shall be statistically analysed as categorical variables and compared between groups.

Cardiovascular clinical composite endpoints at the subject level from the start of procedure until discharge, along with the incidence rates of various events, were statistically analysed according to classification criteria and compared between groups.

Calculate the number of events, incidence rates, and occurrence counts for all adverse events, related adverse events, and serious adverse events in both groups. Cases of study discontinuation due to adverse events and serious adverse events will be listed in a table. Conduct statistical analysis and intergroup comparisons for the incidence rates of individual adverse events and serious adverse events occurring from postprocedure to discharge.

Device deficiency were described using incidence rates.

The clinical significance of laboratory test results shall be presented in pre- and post-procedure cross-tabulation format, with a list of abnormalities deemed clinically significant.

6.6. Efficacy Endpoints (FAS、PPS)

6.6.1. Primary Efficacy Endpoints

Table 18 Device procedural success (18)

Project	Indicator	FAS	Control Group	PPS	Control Group
		Experimental group		Experimental Group	
Device	Success n(%)				

Project	Indicator	FAS		PPS	
		Experimental group	Control Group	Experimental Group	Control Group
procedural Rate	Failure n(%)				
	Total (Missing)				
	Single-group				
	success rate 95% CI				
	Statistic (CMH)				
	P-value				

Note 1: Device procedural success (by lesion level) requires simultaneous fulfilment of the following conditions: a. Successful completion of the entire balloon dilatation procedure, including delivery, lesion crossing, inflation, deflation, retraction, and withdrawal; b. Immediate post-PCI target lesion residual stenosis $\leq 30\%$ (for in-stent restenosis and drug-coated balloon restenosis lesions, post-procedural residual stenosis $< 50\%$). a. Partial analysis presented in Table 20: Device Evaluation; b. Partial analysis presented in Table 21: Immediate Post-PCI Target Lesion Residual Stenosis.

Note 2: For patients in the FAS cohort where the primary efficacy endpoint was not observable, worst observation carried forward was applied; subjects where assessment was inconclusive were counted as failing device use success.

Table 19 Device Success Rate (Lesion Level) Hypothesis Test

Population	Parameter	Experimental group n(%)	Control Group n(%)	Difference in Rates		P	Non-inferiority margin
				Between Groups	Difference in rates between groups Two-sided 95% CI		
FAS	Experimental group - Control group						-10%
PPS	Experimental group - Control group						-10%

Note 1: Rate difference = Experimental group - Control group. The non-inferiority margin is -10%. The 95% confidence interval for the rate difference was calculated using the XX method.

Note 2: The lower limit of the 95% confidence interval for the intergroup success rate difference exceeds -10%, establishing the non-inferiority hypothesis.

Table 20 Device Evaluation (Lesion Level)

	P-value				
	Yes n(%)				
	No n(%)				
	Total (Missing)				
	Statistical measure				
	P-value				
	In-stent restenosis Restenotic lesion				
	N(Missing)				
	Mean (SD)				
In-stent restenosis Postprocedure residual stenosis degree of restenotic lesion $< 50\%$	Median				
	Q1, Q3				
	Min, Max				
	Statistic				
	P-value				
	Yes n(%)				
	No n(%)				
	Total (Missing)				
	Statistical measure				
	P-value				
Drug-eluting stent restenosis lesions	N(Missing)				
	Mean (SD)				
	Median				
	Q1, Q3				
	Min, Max				
	Statistic				
	P-value				
	Postprocedure residual stenosis rate of drug-eluting balloon restenosis lesions $< 50\%$				
	Yes n(%)				
	No n(%)				
Postprocedure residual stenosis rate of drug-eluting balloon restenosis lesions $< 50\%$	Total (Missing)				
	Statistical measure				
	P-value				

Note 1: Primary lesion refers to a lesion with stenosis demonstrated by coronary angiography, excluding in-stent restenosis or drug-eluting balloon restenosis.

Note 2: Analysis of restenosis severity was based on core laboratory data: residual stenosis percentage in the post-procedural segment.

Table 22 Device Success Rates by Centre (Lesion Level)

Research Centre	Item	Indicator	FAS Experimental Group	Control Group	PPS Experimental Group	Control Group
01	Device usage success rate	Success n(%) Failure n(%) Total (Missing)				
02	Device Usage Success Rate	Success n(%) Failure n(%) Total (Missing)				
.....	Success of instrument use	rate Success n(%) Failure n(%) Total (Missing)				

6.6.2. Secondary efficacy endpoint

Table 23 Procedure success rate (subject level)

Item	Indicator	FAS Experimental Group	Control Group	PPS Experimental Group	Control Group
Procedure success rate	Success n(%) Failure n(%) Total (Missing) Statistical measure P-value				

Note: Procedure success (subject level) requires simultaneous fulfilment of the following conditions: a. At least one target lesion residual stenosis $\leq 30\%$ immediately after PCI (postprocedure residual stenosis $< 50\%$ for ISR and drug-coated balloon restenosis lesions); No major adverse cardiac events (MACE) during postprocedure hospitalisation: all-cause mortality, myocardial infarction (MI), and target lesion revascularisation (TLR).

Table 24 Immediate postprocedure target lesion residual stenosis degree (subject level)

Item	Indicator	FAS Experimental group	Control Group	PPS Experimental Group	Control Group
Postprocedure Immediate Lesion Stenosis Meeting Criteria	Yes n(%) Target Residual Degree No n(%) Total (Missing) Statistical measure P-value				

Note: Target achievement denotes at least one target lesion with residual stenosis $\leq 30\%$ immediately postoperatively (ISR and drug-eluting balloon restenosis lesions with residual stenosis $< 50\%$ postoperatively). Analysis of target lesion residual stenosis is based on core laboratory data: residual stenosis within the postprocedure segment in XXX.

Table 25 Major Adverse Cardiac Events (MACE) During Postoperative Hospitalisation (Subject Level)

Item	Indicator	FAS		PPS	
		Experimental Group	Control Group	Experimental Group	Control Group
Incidence of MACE	Yes n(%)				
	No n(%)
