2.1 Study Organization

The contact details of the organization/individuals involved in the study (e.g.; investigator(s), Sponsor's representative(s), laboratories, oversight committees [including institutional review boards (IRBs), as applicable] will be maintained by the Sponsor and provided to the Investigator.

3. STUDY CHANGES IN RESPONSE TO COVID-19 PANDEMIC

The study Sponsor will continuously monitor and evaluate the development of the COVID-19 pandemic in the area of study sites to determine if any measures need to be implemented to mitigate undue risks to the subjects or in response to local governmental recommendations. Such measures may include, temporarily halting further recruitment, switching in-person visits to phone calls, or employing mobile teams to collect serum samples. Any measure would be communicated to the relevant CA and IRB. For information on COVID-19 management refer to Section 10.6.

4. SERIOUS ADVERSE EVENT REPORTING

The Investigator will comply with applicable laws/requirements for reporting serious adverse events (SAEs) to the IRB. For information on the definition and assessment of adverse events (AEs), refer to Section 17.1.

All SAEs should be reported on the SAE Report Form to the PRA Safety Desk by fax or email within 24 hours after the Investigator has become aware of the event. Under certain circumstances the initial notification could be done by phone, but nevertheless a written SAE Report Form has to be submitted within 24 hours to:

<u>PRA Safety Desk</u>	
Fax:	+1 888 772 6919
Email:	MHGSafety@prahs.com
Safety Hotline:	+1 800 772 2215

5. ADVERSE EVENTS OF SPECIAL INTEREST REPORTING

The Investigator will comply with applicable laws/requirements for reporting adverse events of special interest (AESIs) to the IRB. For information on the definition and assessment of adverse events of special interest (AESIs), refer to Section 17.1.

All AESIs should be reported on the AESI Report Form to the PRA Safety Desk by fax or email within 48 hours after the Investigator has become aware of the event. Under certain circumstances the initial notification could be done by phone, but nevertheless a written AESI Report Form has to be submitted within 48 hours to:

<u>PRA Safety Desk</u>	
Fax:	+1 888 772 6919
Email:	MHGSafety@prahs.com
Safety Hotline:	+1 800 772 2215

6. PREGNANCY REPORTING

The Investigator will comply with applicable laws/requirements for reporting pregnancies to the IRB. For information on the definition and assessment of pregnancies, refer to Section 17.13.3.

All Pregnancies* should be reported on the Pregnancy Report Form to the PRA Safety Desk by fax or email within 24 hours after the Investigator has become aware of the event.

<u>PRA Safety Desk</u>	
Fax:	+1 888 772 6919
Email:	MHGSafety@prahs.com
Safety Hotline:	1 800 772 2215

* A pregnancy is not considered an SAE. If a seriousness criterion applies in addition to the pregnancy (e.g. hospitalization, congenital anomaly/birth defect) the pregnancy qualifies as an SAE. In such case a Pregnancy Report Form **and** an SAE Report Form have to be filled out

7. CLINICAL STUDY SYNOPSIS

INVESTIGATIONAL PRODUCT, DOSAGE AND MODE OF ADMINISTRATION	
Title	A MULTICENTER, RANDOMIZED, CONTROLLED, DOUBLE-BLINDED PIVOTAL STUDY TO EVALUATE SAFETY AND IMMUNOGENICITY OF A LIVE-ATTENUATED CHIKUNGUNYA VIRUS VACCINE CANDIDATE (VLA1553) IN ADOLESCENTS AGED 12 YEARS TO <18 YEARS
Name of Investigational Medicinal Product (IMP)	Live-attenuated Chikungunya (CHIKV) vaccine (VLA1553)
Name(s) of Active Ingredient(s)	Live-attenuated CHIKV vaccine strain based on the La Reunion strain (LR-CHIKV clone LR2006-OPY1) of East/ Central/ South African (ECSA) genotype (del5nsP3)
<p>VLA1553 is a live-attenuated chikungunya virus (CHIKV) vaccine candidate designed for active immunization for the prevention of disease caused by CHIKV. The candidate vaccine is intended to prevent CHIKV infections in the general population living in endemic regions, as well as to serve as a prophylactic measure for travelers to epidemic areas or areas at risk for an upcoming outbreak or ongoing endemic transmission. The replicating CHIKV vaccine comprises a large deletion of 60 amino acids in the nsP3 gene (del5nsP3) encoding the non-structural replicase complex protein nsP3, which leads to attenuation of the virus <i>in vivo</i>.</p> <p>In this pivotal Phase 3 study, VLA1553 at the dose level tested previously in Phase 3 in adults, will be evaluated for safety and immunogenicity in adolescents aged 12 to <18 years. The study will be carried out in multiple sites in a CHIKV endemic country (i.e. Brazil). VLA1553 and control (i.e. placebo) will be administered intramuscularly (i.m.) into the deltoid muscle as a single-shot immunization on Day 1. All subjects will be followed up for safety for 6 months after immunization. A subset will be evaluated for viremia, as well as immunogenicity including antibody persistence for up to 12 months. The vaccine presents in a lyophilized dosage form.</p> <p>CHIKV is a small spherical RNA virus and a member of the Alphavirus genus in the family <i>Togaviridae</i>. The arthropod-borne virus is closely related to other viruses in Africa, South America and Australia that cause similar symptoms such as o'nyong-nyong-virus, Mayaro-virus or Ross River Virus, respectively. The virus is vectored by the daytime-biting <i>Aedes aegypti</i> mosquito, which is also transmitting yellow fever, Zika and Dengue viruses. CHIKV can also be transmitted by <i>Aedes albopictus</i> mosquitoes, a more cold-tolerant mosquito that could result in the spread of chikungunya to more temperate areas of the world.</p> <p>CHIKV has been reported in over 100 countries with more than 2.2 million suspected cases reported to the Pan American Health Organization (PAHO) in the Americas alone until now. CHIKV epidemics are explosive and rapidly moving, but not predictable.</p> <p>An infection with CHIKV results in chronic and incapacitating arthralgia affecting all gender and age groups accompanied by an acute febrile disease with headache, muscle pain, and skin rashes. Although children over 2 years of age have typically milder disease symptoms and higher rates of asymptomatic infection than adults, severe manifestations such as skin eruptions, meningoencephalitis and septic shock can occur. Individuals who are at higher risk of more serious complications include</p>	

<p>infants, the elderly and individuals with underlying chronic medical conditions. Currently, neither specific antiviral treatment nor a vaccine is available to prevent CHIKV infection. Prevention against CHIKV infection is therefore limited to non-treatment interventions such as the deployment of insecticides, wearing long sleeves and pants and repellants, and other means to restrict exposure to vector mosquitos.</p>	
CLINICAL CONDITION(S)/INDICATION(S)	
Active immunization for the prevention of disease caused by CHIKV	
STUDY PHASE	Pivotal Phase 3
PLANNED STUDY PERIOD	
Initiation	Q1 2022 (after having Day 29 safety and immunogenicity data available from the pivotal trial in adults (VLA1553-301))
Duration	<p>The overall study duration (First Subject In – Last Subject Out) is estimated to be approximately 22 months.</p> <p>Individual subject participation is approximately 7 months or 13 months (immunogenicity subset) from enrollment to study completion, unless prematurely discontinued.</p>
Completion	<p>Part A (Visit 3, Day 29): planned Q1 2023</p> <p>Part B (Visit 5, Month 6): planned Q3 2023</p> <p>Part C (Visit 6, Month 12): planned Q1 2024</p> <p>Individual study parts will be analyzed sequentially.</p>
STUDY OBJECTIVES	
<p>Primary Objective</p> <p>➤ To evaluate immunogenicity and safety of the adult dose of the live-attenuated CHIKV vaccine candidate (VLA1553) 28 days following vaccination in adolescents aged 12 years to <18 years after a single immunization.</p> <p>Secondary Objectives</p> <p>➤ To assess the immunogenicity and safety of the adult dose of VLA1553 following vaccination in adolescents aged 12 years to <18 years after a single immunization up to Month 12.</p> <p>➤ To assess the immunogenicity and safety of VLA1553 in subjects previously exposed to chikungunya virus.</p> <p>Exploratory Objectives</p> <p>➤ To evaluate the efficacy of VLA1553 in adolescents aged 12 years to <18 years after a single immunization.</p> <p>➤ To collect information on the CHIKV disease clinical spectrum and associated risk factors in an adolescent population.</p>	

STUDY DESIGN	
Investigator and sites	Multicenter study. The study will be conducted at approximately 5-10 study sites in an endemic country (i.e. Brazil).
Study participants	A total of 750 male and female adolescents aged 12 years to <18 years will be enrolled and randomized 2:1 to either the adult dose of VLA1553 or control. Volunteers will be screened by ELISA for evidence of previous CHIKV exposure. Enrolled subjects considered eligible will subsequently be stratified by CHIKV baseline serostatus: - 20% CHIKV seropositive subjects (i.e. IgM+/IgG+ or IgM-/IgG+) - 80% CHIKV seronegative subjects (i.e. IgM-/IgG-)
Study Type	Safety and immunogenicity
Vaccine Type	Live-attenuated CHIKV in a lyophilized formulation (1x10E4 TCID ₅₀ per 0.5 mL)
Control Type	Placebo (phosphate buffered saline, PBS) in a liquid formulation
Study Indication Type	Prevention
Blinding Scheme	Blinded (double-blind, i.e. the subject as well as study site staff/ Investigator/ Sponsor remain blinded to treatment allocation)

Study Design

This is a multicenter, prospective, randomized, double-blinded, pivotal clinical study evaluating the adult dose (1 x10E4 TCID₅₀ per 0.5 mL) of VLA1553 in comparison to a placebo control. VLA1553 and control will be administered as single immunization on Day 1. Overall, 750 male and female subjects aged 12 years to <18 years will be enrolled (i.e. ICF/assent signed) in the study, stratified by ELISA baseline serostatus: 20% seropositive and 80% seronegative for CHIKV.

As safety precaution, the study will be initiated with an age de-escalation of sentinel cohorts. Enrollment will start with 30 sentinel subjects from Cohort I (15 to <18 years) that will allow the generation and review of safety data before enrollment of sentinel subjects from Cohort II (12 to <15 years) is initiated.

Subjects will be randomized in a 2:1 ratio to VLA1553 (n= 500) or control group (n= 250). Approximately 385 subjects will be randomized to the immunogenicity subset[†]. Thereof, approximately 75 subjects will constitute the viremia subset.

Table 1 below illustrates the study groups.

Table 1: Study groups and study subsets

Study Groups	Treatment	Number of subjects	Immunogenicity (Viremia) Subset
		(n)	(n)
Study Arm 1	VLA1553^a	500	335 (50)
	<i>Seropositive</i>	<i>100</i>	<i>67 (10)</i>
	<i>Seronegative</i>	<i>400</i>	<i>268 (40)</i>
Study Arm 2	Control	250	50 (25)
	<i>Seropositive</i>	<i>50</i>	<i>10 (5)</i>
	<i>Seronegative</i>	<i>200</i>	<i>40 (20)</i>
Total N		750	385 (75)

^a dose used for Phase 3 trials in adults

All subjects will return to the study site at Day 8 (Visit 2), Day 29 (Visit 3), Month 3 (Day 85, Visit 4) and Month 6 (Day 180, Visit 5) for safety evaluations and immunogenicity sampling. At Day 1 (Visit 1), immunogenicity analysis will be performed for all subjects for stratification by baseline µPRNT serostatus. Thereafter, immunogenicity analysis and evaluations will only be done in the immunogenicity subset. Subjects in the viremia subset will have viremia samples collected at Visits 1,

[†] All sentinel subjects of Cohort I and Cohort II will be allocated to the Immunogenicity subset.

2 and 3. Samples from Visit 1 and 2 will be analyzed. The collected viremia sample of Visit 3 will only be analyzed if sample of Visit 2 is positive. In addition, for clinically indicated retrospective analysis viremia samples will be collected throughout the study from all subjects. Safety data collection will capture all AEs up to Month 6 (Visit 5). After Day 180 (Visit 5), AE collection will be limited to SAEs.

Subjects from the immunogenicity subset will also return to the study site at Month 12 (Day 365, Visit 6) for collection and assessment of immunogenicity samples. In addition, a clinical sample for safety laboratory evaluations will be obtained at all study visits from the immunogenicity subset only.

The clinical study design is displayed in the **Figure 1** below.

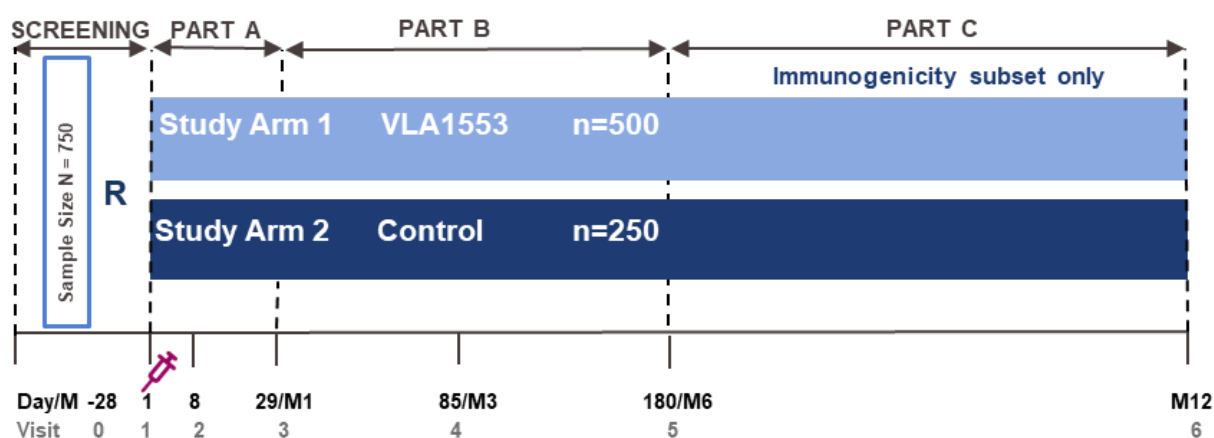

Figure 1. Adolescents Pivotal Clinical Study Design

M = month;

If VLA1553 is proven to be safe and effective, it will be offered to the control group at the end of the study if approved by Brazilian regulatory authorities.

SUBJECT ENROLLMENT

As a safety precaution, the study will be initiated with an age de-escalation of sentinel cohorts as described in Figure 12.1- 2. Subjects will be recruited in two cohorts as follows:

Cohort I (15 to <18 years):

The enrollment will start with 30 sentinel subjects aged 15 to <18 years (Cohort I). Subjects will be randomized 2:1 to receive VLA1553 or control. Specifically, a maximum of 10 sentinels will be vaccinated per day and observed at the study site for one hour after vaccination for safety and reactogenicity. If no immediate safety concerns arise as determined by the Investigator, the next

sentinels of this Cohort will be vaccinated and observed for one hour. All sentinels of Cohort I are to return to the study site 7 days post-vaccination for safety follow-up (Visit 2). If the safety profile is considered favorableⁱⁱ by the principal investigator of the study site vaccinating the sentinel subjects and Sponsor, enrollment of Cohort II (12 to <15 years) can be initiated. Enrollment of subjects of Cohort I will continue without limitations.

Cohort II (12 to <15 years):

The enrollment will start with 30 sentinel subjects aged 12 to <15 years (Cohort II). Subjects will be randomized 2:1 into VLA1553 or control. Specifically, a maximum of 10 sentinels will be vaccinated per day and observed at the study site for one hour after vaccination for safety and reactogenicity. If no immediate safety concerns arise as determined by the Investigator, the next sentinels of this Cohort will be vaccinated and observed for one hour. All sentinels of Cohort II are to return to the study site 7 days post-vaccination for safety follow-up (Visit 2). If the safety profile is considered favorableⁱ by the principal investigator and Sponsor, enrollment will continue without limitations.

STUDY ENDPOINTS

Primary Endpoint

- Proportion of subjects with a seroprotective CHIKV antibody level defined as $\mu\text{PRNT}_{50} \geq 150$ for μPRNT baseline negative subjects 28 days post-vaccination.

Secondary Endpoints

Immunogenicity:

- Immune response as measured by CHIKV-specific neutralizing antibody titers on Day 8, Day 29, Day 85, Day 180, and Month 12 post-vaccination as determined by μPRNT assay;
- Proportion of subjects with seroprotective levels (defined as $\mu\text{PRNT}_{50} \geq 150$ for μPRNT baseline negative subjects)ⁱⁱⁱ on Day 8, Day 85, Day 180 and Month 12 post-vaccination as determined by μPRNT assay;
- Proportion of subjects with seroconversion^{iv} as compared to baseline at Day 29, Day 180 and Month 12 as determined by μPRNT assay;
- Fold increase of CHIKV-specific neutralizing antibody titers determined by μPRNT assay at Days 8, 29, 85, 180 and at Month 12 post-vaccination as compared to baseline;
- Proportion of subjects reaching an at least 4-fold, 8-fold, 16-fold or 64-fold increase in CHIKV-specific neutralizing antibody titer compared to baseline as measured by μPRNT assay;

ⁱⁱ None of the DSMB review criteria as outlined in Section 12.1.2 are met.

ⁱⁱⁱ Seroprotective threshold derived from animal passive transfer experiments.

^{iv} Seroconversion defined as >4-fold increase of μPRNT_{50} compared to baseline (Day 1).

- Antibody titers, seroprotection and fold increases for CHIKV-specific neutralizing antibodies, determined by μ PRNT assay at Days 1, 8, 29, 85, 180, and Month 12 post-vaccination stratified by μ PRNT baseline serostatus.

Safety:

- Frequency and severity of unsolicited AEs until Day 29 and Month 6 post-vaccination;
- Frequency and severity of solicited injection site and systemic reactions within ten days post-vaccination;
- Frequency and relatedness of any serious adverse event (SAE) during the entire study period;
- Frequency and severity of any early onset adverse event of special interest (AESI) starting within 2 to 21 days post-vaccination (i.e. Day 3 – Day 22);
- Frequency and severity of any late onset adverse event of special interest (AESI) during the entire study starting 22 days post-vaccination (i.e. Day 23 – study end);
- Assessment of viremia on Days 1 and 8 (and Day 29, if applicable) after vaccination.

Exploratory Endpoints

- Incidence of CHIKV infections with onset 14 days post-vaccination as evidenced by viremia by virus specific RT-qPCR, clinical diagnosis and seroconversion by μ PRNT for the entire study period;
- Accumulate data of CHIKV disease signs and symptoms in adolescent population as assessed following vaccination on Day 1 for the entire study period.

DIAGNOSIS AND CRITERIA FOR INCLUSION / EXCLUSION

Approximately 750 adolescents aged 12 years to <18 years of either gender who satisfy the inclusion and exclusion criteria listed below will be invited to participate in the study.

Inclusion Criteria

Subjects who meet **ALL** of the following criteria are eligible for this study:

1. Male or female adolescents aged 12 years to <18 years^v at the time of vaccination.
2. Written informed consent by the subject's legal representative(s), according to local requirements, and written informed assent of the subject, if applicable;

^v From the 12th birthday to the last day before the 18th birthday.

3. Subject is generally healthy^{vi} as determined by the Investigator's clinical judgement based on medical history, physical examination and screening laboratory tests;
4. Subject is seropositive for previous CHIKV exposure (i.e. IgM+/IgG+ or IgM-/IgG+) or seronegative (i.e. IgM-/IgG-) as screened by CHIKV-specific ELISA^{vii}.
5. If subject is of reproductive potential:
 - a) Subject has a negative serum or urine pregnancy test at screening (Visit 0) or Day 1 (Visit 1), respectively.
 - b) Subject has practiced an adequate method of contraception during the 30 days before screening (Visit 0).
 - c) Subject agrees to employ adequate birth control measures for the first three months post-vaccination (i.e. until Day 85, Visit 4). This includes one of the following measures:
 - Hormonal contraceptives (e.g. implants, birth control pills, patches);
 - Intrauterine hormone-release systems;
 - Barrier type of birth control measure (e.g. condoms, diaphragms, cervical caps);
 - Vasectomy in the male sex partner \geq 3 months prior to first vaccination
 - Sex abstinence;
 - Same- sex relationships.

Exclusion Criteria

Subjects who meet **ANY** of the following criteria are **NOT** eligible for this study:

1. Subject is taking medication or other treatment for unresolved symptoms attributed to a previous CHIKV infection; or has participated in a clinical study involving an investigational CHIKV vaccine;
2. Subject has an acute or recent infection (and who is not symptom-free in the week prior to the Screening Visit (Visit 0));
3. Subject tests positive for human immunodeficiency virus (HIV), hepatitis B surface antigen (HBsAg) or hepatitis C virus (HCV);
4. Subject has received another live virus vaccine within 28 days or inactivated vaccine within 14 days prior to vaccination in this study or plans to receive a live virus vaccine within 28 days or inactivated vaccine within 14 days after vaccination, respectively;
5. Subject has abnormal findings in any required study investigations (including medical history, physical examination, and clinical laboratory) considered clinically relevant by the Investigator which pose a risk for participation in the study based on his/her judgement;
6. Subject has a medical history of or currently has acute or progressive, unstable or uncontrolled clinical conditions (e.g. cardiovascular, respiratory, neurologic, psychiatric, or rheumatologic

^{vi} Subjects are considered **generally healthy** if (1) any chronic illness/condition, e.g. hypertension, type 2 diabetes mellitus, or hyperlipidemia is stable and well-controlled on therapy for the past 6 months, and (2) they do not have a disease that is identified as an exclusion criterion.

^{vii} Subjects who are IgM+/IgG- do not qualify for participation in this study.

- conditions) that poses a risk for participation in the study, based on Investigators clinical judgement. Examples include individuals with poorly controlled or unstable disease, ongoing suspected or active inflammation, or poor compliance with pharmacologic treatment, or presence of high-risk comorbidities (e.g. significant cardiopulmonary disease);
7. Subject has a history of immune-mediated or clinically relevant arthritis/arthritis;
 8. Subject has a history of malignancy in the past 5 years other than squamous cell or basal cell skin cancer. If there has been surgical excision or treatment more than 5 years ago that is considered to have achieved a cure, the subject may be enrolled. A history of hematologic malignancy is a permanent exclusion. Subjects with a history of skin cancer must not be vaccinated at the previous tumor site;
 9. Subject has a known or suspected defect of the immune system that can be expected to influence the immune response to the vaccine, such as subjects with congenital or acquired immunodeficiency, including infection with HIV, status post organ transplantation or immuno-suppressive therapy within 4 weeks prior to Visit 1. Immuno-suppressive therapy is defined as administration of chronic (longer than 14 days) prednisone or equivalent ≥ 2 mg/kg/day within 4 weeks prior to study entry, radiation therapy or immunosuppressive cytotoxic drugs/ monoclonal antibodies in the previous 3 years; topical and inhaled steroids are allowed.
 10. Subject has a history of any vaccine related contraindicating event (e.g., anaphylaxis, allergy to components of the candidate vaccine, other known contraindications);
 11. Subject presents with clinical conditions representing a contraindication to intramuscular vaccination and blood draws;
 12. Subject is pregnant (positive serum or urine pregnancy test at screening or Visit 1, respectively), has plans to become pregnant or subject's female partner plans to become pregnant during the first three months post-vaccination or subject is lactating at the time of enrollment;
 13. Subject has received blood-derived products (e.g. plasma) within 90 days prior to vaccination in this study or plans to use blood products until Day 180 of the study;
 14. Subject has a rash, dermatological condition or tattoos that would, in the opinion of the Investigator, interfere with injection site reaction rating;
 15. Subject has a known or suspected problem with alcohol or drug abuse as determined by the Investigator;
 16. Subject has any condition that, in the opinion of the Investigator, may compromise the subjects well-being, might interfere with evaluation of study endpoints, or would limit the subject's ability to complete the study;
 17. Subject is committed to an institution (by virtue of an order issued either by the judicial or the administrative authorities);
 18. Subject has participated in another clinical study involving an investigational medicinal product (IMP) or device within 30 days prior to study enrollment or is scheduled to participate in another clinical study involving an IMP, or device during the course of this study;

19. Subject is a member of the team conducting the study or in a dependent relationship with one of the study team members. Dependent relationships include close relatives (i.e., children, partner/spouse, siblings, parents) as well as employees of the Investigator or site personnel conducting the study.

Delay Criteria

Vaccination will be delayed if:

1. Subject has an acute febrile infection within 72 hours prior to vaccination or axillary temperature greater than or equal 37.8°C on the day of vaccination (subject may be rescheduled within the screening visit window until subject has completed 72 hours without fever).
2. Subject has received antipyretics within 4 hours prior to the scheduled time of vaccination (subject may be rescheduled within the screening visit window).
3. Subject has received any live or inactivated vaccine within 28 days or 14 days prior to vaccination, respectively.
4. IMP is unavailable at the site (e.g.: logistics problems) or under quarantine*.
5. In case of no blood sample result available (e.g. out of stability samples) due to logistical problems at Screening (V0), and the permission of at least one legal representative to recollect the missing sample*.

In addition, for a rescheduled vaccination all inclusion and none of the exclusion criteria must be met. In case not all of these criteria are met, the subject will be excluded from the study.

The rescheduled visit should be within the specified time window for the vaccination visit. In case the time window for the rescheduled visit cannot be met, the subject might be invited for a re-screening.

* To respect the subjects right to participate in this study, these criteria are implemented by the sites after receiving local IRB approval. The description of the entire process is documented in the source documents by the investigator, since these delay criteria were not included in the previous version of the clinical study protocol. Additionally, for recollection of a blood sample the permission of at least one legal representative has to be documented in the source documents and is only allowed once.

STATISTICAL ANALYSIS *(requires statistical review)***Sample Size Justification**

The total number of 500 subjects exposed to VLA1553 in this study has been selected to provide a sufficient number of subjects for proper safety evaluation in the adolescent's subgroup. With 500 subjects exposed, the study will provide 95% confidence that an AE does not occur at a frequency of 1:166 or 0.6% or higher, if not observed in the study.

The immunogenicity subset of 268 VLA1553-vaccinated ELISA baseline seronegative subjects will allow for sufficient statistical power when applying a one-sided exact binomial test with a significance level of 2.5% against a non-acceptance threshold of 70% on the proportion of subjects with a seroprotective level (defined as $\mu\text{PRNT}_{50} \geq 150$ for μPRNT baseline seronegative subjects) at Day 29. A seroprotection rate (SPR) of 80% is assumed, and 200 VLA1553-vaccinated subjects would thus be necessary for a statistical power of 90%. With an expected drop-out/major protocol deviations rate of

approximately 10%, at least 223 seronegative subjects vaccinated with VLA1553 need to be allocated to the immunogenicity subset.

Statistical Methods

All analyses of immunogenicity data will be performed primarily on the PP and secondarily on the IMM.

The primary immunogenicity analysis will be a comparison of the observed proportion of baseline seronegative subjects (based on μ PRNT) with a seroprotective CHIKV antibody level (defined as μ PRNT₅₀ \geq 150) at Day 29 (i.e. 28 days post-vaccination) against a non-acceptance threshold of 70%. An exact binomial test for the null-hypothesis H0: SPR \leq 70% against the alternative H1: SPR $>$ 70% with a one-sided significance level of 2.5% will be applied and exact (Clopper-Pearson) two-sided 95% confidence limits will be calculated.

Secondary immunogenicity analysis will include the comparison of the GMTs and GMFIs for various study days between the VLA1553 and control group by visit using ANOVA (factor study group, covariate baseline serostatus).

In addition, the seroprotection and seroconversion rates and proportion of subjects reaching an at least 4-fold, 8-fold, 16-fold or 64-fold increase in CHIKV-specific neutralizing antibody titer compared to baseline (based on μ PRNT) for various study days will be compared between the study arms by Fisher's exact test and exact 95% confidence intervals will be calculated.

All subjects entered into the study, who received the single vaccination, will be included in the safety analysis.

Safety tabulations will generally be provided separately for solicited AEs and unsolicited AEs, and for both types of AEs combined. 95% confidence intervals according to Altman will generally be provided for all AE rates and differences between study groups will be assessed for significance using Fisher's exact test.

The number and percentage of subjects with any AE, any solicited AE, unsolicited AE, any related unsolicited AE, any related severe AE, any SAE, any related SAE, any medically attended AE, any AE leading to withdrawal from study, and any AE occurring at a frequency of at least 10% and at least 1% in at least one study arm, up to Day 29, Day 85 and up to Day 180, and any AESI (i.e. early and late onset AESI) till Month 12, and any related AESI up to Day 21, will be presented for each study arm, overall and by system organ class/preferred term.

Data Analysis

The following data analyses will be performed:

- Part A includes safety and immunogenicity data after all subjects have completed Visit 3 (Day 29).
- Part B includes safety and immunogenicity data after all subjects have completed Visit 5 (Month 6).
- Part C includes safety and immunogenicity data after all subjects in the immunogenicity subset have completed Visit 6 (Month 12).

Individual study parts will be analyzed sequentially.

Clinical Study Reports

The Part A analysis will be performed once the last subject has completed the study Visit 3, i.e. Day 29. Part B and C analysis will be performed once the last subject has completed the study Visit 5, i.e. Month 6, or study Visit 6, i.e. Month 12, respectively. Part A will be unblinded (blind will be maintained for study sites) and serves as primary endpoint analysis providing early analysis of vaccine efficacy.

A Clinical Study Report will be compiled following each data analysis.

10. INTRODUCTION

10.1 Valneva's Candidate Vaccine

The vaccine candidate VLA1553 is designed to target all globally circulating CHIKV strains for the active prevention of chikungunya infection in endemic regions and for travelers to epidemic areas or high-risk areas. VLA1553 is based on the chikungunya La Reunion strain (LR-CHIKV clone LR2006-OPY1) of East/ Central/ South African (ECSA) genotype and is characterized by a genetically-engineered 60 amino acid deletion in its nsP3 viral replicase complex gene which leads to an attenuation of the virus *in vivo*. VLA1553 is genetically stable and passaged three times on African green monkey kidney (Vero) cells and contains no adjuvant. VLA1553 is intended to facilitate a rapid development of a protective antibody titer.

Valneva Austria GmbH has successfully completed a Phase 1 and two pivotal Phase 3 clinical trials of a novel live-attenuated vaccine for prophylaxis of the disease caused by Chikungunya virus (CHIKV). Additionally, a long-term follow-up study is currently ongoing.

VLA1553 investigation was designated as a fast-track development program by the United States (US) Food and Drug Administration (FDA) in 2019.

For further details please refer to the Investigator's Brochure.

10.2 Clinical Condition/Indication

10.2.1 Transmission, Disease and Diagnosis

CHIKV is a mosquito-borne virus which was first isolated in 1953, during an epidemic of polyarthralgia in Tanzania (Robinson 1955). The word 'chikungunya' means 'that which bends up' in Swahili, in reference to the stooped posture of patients afflicted with the severe joint pain associated with this disease. Since its first isolation CHIKV was found to occasionally cause smaller outbreaks during the following decades in Africa, India, the Indian Ocean Islands, and Southeast Asia (Suhrieb, Jaffar-Bandjee et al. 2012; Simon, Javelle et al. 2015).

Within the human population, CHIKV is maintained by a human-mosquito-human transmission probably following a dengue-like model characterized by the absence of an animal reservoir and the ability to spread rapidly among human beings via domestic and peridomestic mosquitoes (Her et al. 2009; Pialoux et al. 2007). CHIKV was typically transmitted only by *Aedes aegypti* mosquitos, however coinciding with an adaptation enabling unusually efficient transmission by *Aedes albopictus* mosquitos, the virus re-emerged in 2004 and rapidly spread over Africa, Asia and locally also in Europe (Delisle, Rousseau et al. 2015). More recently CHIKV also has spread across the Americas with millions of people becoming infected (Rezza, Weaver et al. 2019). In Brazil, more than 50% of municipalities were affected by CHIKV

disease according to the Brazilian Ministry of Health in 2018. Earlier in 2014, autochthonous cases of CHIKV were reported in two regions of Brazil in parallel (i.e. Northern, in Oiapoque/Amazonas and Northeast in two cities: Feira de Santana and Riachão do Jacuípe-Bahia). Serologic studies in the two north-eastern areas indicate that 57.1% and 45.7% of the population, respectively, were CHIKV-positive (by CHIKV-specific ELISA) and >45% of the participants had antibodies against CHIKV (Dias et al, 2018). These data cannot be extrapolated to whole Brazil since the study was conducted in areas with the highest density of CHIK cases during the epidemic. In 2019, approximately 100.000 cases of CHIKV were reported in Brazil (Ministério da Saúde 2019). However, assessment of CHIKV disease incidence is often not accurate due to misdiagnosis to other circulating febrile diseases, the lack of serological confirmation and asymptomatic manifestations of CHIKV.

CHIKV is an enveloped alphavirus of the family *Togaviridae*. It carries a single-stranded positive sense genomic RNA of around 12 kb containing two open reading frames that encode four nonstructural replicase proteins (nsP1-4) and a structural polyprotein consisting of the capsid protein (C) and the envelope proteins (E3-E2-6K/TF-E1), respectively. The replicase complex serves two functions: it replicates the genomic RNA for incorporation into new virus particles and it also has transcriptase activity to produce a mRNA from a subgenomic promoter that encodes the structural proteins (Simizu, Yamamoto et al. 1984). Mature virions that bud from the plasma membrane of infected cells carry 240 copies of E2-E1 glycoproteins arranged into 80 heterotrimeric spike complexes. The E2 protein is the receptor-binding moiety, whereas the E1 protein is involved in fusion of the virion envelope with the target cell endosomal membrane (Voss, Vaney et al. 2010). Accordingly, it is the spike complex and in particular the E2 envelope protein that is the target for neutralizing antibodies.

An infection with CHIKV results in chronic and incapacitating arthralgia affecting all gender and age groups (Couderc, Khandoudi et al. 2009; Suhrbier, Jaffar-Bandjee et al. 2012; Simon, Javelle et al. 2015). CHIKV clinical symptoms typically are presented in three stages that differ in clinical features and treatment. During the acute stage, clinical symptoms manifest with common features such as fever, transient rash and multiple arthralgia/arthritis episodes. This is followed by a multi-morbid post-acute and chronic stage characterized by persisting rheumatic symptoms up to months and years after infection and impaired quality-of-life (Marimoutou, Ferraro et al. 2015; Simon, Javelle et al. 2015). Symptoms of CHIKV disease usually appear 4–7 days post-infection and include rapid onset of fever, viremia, severe joint pain, recurring mild joint pain, maculopapular rash, and may lead to death (Simon, Javelle et al. 2015).

Little is known on CHIKV disease signs and symptoms in children, but studies indicate that children over 2 years of age typically have milder disease symptoms and higher rates of asymptomatic infection than adults (Gordon et al. 2018; Martins, Prata-Barbosa, and Cunha

2020; Ritz et al., 2015). Atypical severe manifestations include skin eruptions, meningoencephalitis and septic shock (Dhochak et al. 2019; Garg et al. 2018; Sharma et al. 2018; Singh and Jain 2017; Beserra et al. 2019) with rapid onset of fever in the first few days of acquiring the infection. In addition, the pediatric population induces a higher level of several immune mediators when compared to the adults. Pro-inflammatory cytokines (TNF- β , TRAIL, IL-5, GRO- α , IL-18, IFN- α 2, IL-2Ra), chemokines (MIF, MIG, MCP-3, G-CSF), and growth and other factors (SCGF- β , M-CSF, HGF, SCF, LIF, IL-3) appear to be significantly higher in children compared to adults while IL-1 β , RANTES, SDF-1 α and β -NGF are significantly lower in children (Simarmata et al. 2016).

With the awareness of the potentially serious consequences of neonatal and pediatric CHIKV infections, much greater attention is now being given to arboviral infection in these vulnerable populations (Barr and Vaidhyanathan 2019). Consequently, morbidity due to this virus is a serious threat to global health in both pediatric and adult populations. There is an urgent medical need for a prophylactic approach against CHIKV infection since no specific treatment is currently available to prevent or treat CHIKV disease.

Prevention against CHIKV infection is therefore limited to non-treatment interventions such as the employment of insecticides, wearing long sleeves and pants and repellents, and other means to restrict exposure to vector mosquitos. The treatment of CHIKV disease is mainly supportive such as bed rest, adequate fluids, and symptomatic relief by using analgesics, antipyretics like paracetamol, or anti-inflammatory drugs like ibuprofen and naproxen for the control of fever and joint pain. Persons who have persistent joint pain may require analgesic or long-term anti-inflammatory therapy (Simon, Javelle et al. 2015).

For detailed information on the disease and epidemiology please refer to the Investigator's Brochure.

10.2.2 Prospects for Vaccine Development

A number of CHIKV vaccine candidates is currently under preclinical and clinical development, ranging from inactivated whole virus vaccine compositions, over virus-like-particle approaches to RNA and DNA vaccine candidates (Schrauf et al. 2020).

A former CHIKV vaccine candidate was a serially passaged, live-attenuated CHIKV vaccine (TSI-GSD-218 or 181/clone 25) developed by the Walter Reed Army Institute of Research (WRAIR, US). The TSI-GSD-218 CHIKV isolate was derived from a patient during the Thailand outbreak in 1962 and was subsequently serially passaged on human lung cell cultures. The live-attenuated vaccine candidate was investigated in numerous Phase 1 and Phase 2 trials with a dose of 3×10^4 PFU/mL. The WRAIR vaccine was administered i.m. as well as subcutaneous (s.c.) as a single vaccination offering long-term protection (McClain, Pittman et

al. 1998, Edelman, Tacket et al. 2000). However, clinical development efforts were terminated in 1998 (Hoke, Pace-Templeton et al. 2012).

In addition, a measles-virus-based CHIKV vaccine developed by Themis, AT, has completed Phase 1 and Phase 2 studies. Published results of a Phase 2 clinical trial investigating two immunizations of escalating dose levels at four sites in Austria and Germany showed that the vaccine was found to be safe and well-tolerated with a good immunogenicity profile (Ramsauer, Schwameis et al. 2015, Reisinger et al. 2018).

Furthermore, the National Institutes of Allergy and Infectious Disease (NIAID), later acquired by PaxVax, now Emergent BioSolutions, developed a Virus-like particle (VLP) vaccine for prophylaxis of CHIKV. First-in-human and Phase 2 studies demonstrated in non-endemic and endemic regions of the Caribbean that the VLP vaccine candidate is safe, well-tolerated and immunogenic after two vaccinations supporting Phase 3 entry (Chen et al. 2020; Chang et al. 2014). An additional Phase 2 trial conducted in the US from 2018 to 2020 demonstrated that the vaccine candidate was well tolerated and induced a robust and durable serum neutralizing antibody immune response against CHIKV up to 2 years. Subsequently, Emergent BioSolutions initiated a Phase 3 trial enrolling 3,150 healthy adolescents and adults aged 12 to 64 years in 2021 (Stephenson 2022, Bennett et al. 2022).

With the increase of international travel in the past years and the spread of potential vectors, infections caused by CHIKV are likely to expand on a global scale and may result in overlapping regions of endemicity (Hochedez, Jaureguiberry et al. 2006). Consequently, morbidity due to this virus is a serious threat to global health, and CHIKV has been listed as a priority pathogen by the National Institutes of Allergy and Infectious Disease (NIAID) in the United States (Suhrbier, Jaffar-Bandjee et al. 2012; Simon, Javelle et al. 2015; NIAID October 26, 2016) and raises an urgent demand for efficient prophylaxis, providing a strong justification for the development of a vaccine.

10.3 Findings From Nonclinical and Clinical Studies

10.3.1 Non-clinical Summary

The safety, immunogenicity and protective potency of the CHIKV vaccine candidate VLA1553 have been assessed in numerous non-clinical studies.

The non-clinical development program has focused on the establishment of a small animal as well as non-human primate (NHP) model allowing for the evaluation of the CHIKV candidate vaccine with respect to safety and efficacy, i.e. immunogenicity and protection (Hallengård et al. 2014). To this end, mouse models have been investigated and were shown to be permissive for infection with a wild-type (wt) CHIKV isolate, LR2006 OPY-1. Thus, infection of mice with wt CHIKV was shown to cause significant viremia, a major sign also in humans (Couderc and

Lecuit 2009). In addition, NHPs serve as excellent animal models for understanding CHIKV pathogenesis as they are a natural amplification host for CHIKV and share significant genetic and physiological homology with humans. CHIKV infection in NHPs results in acute fever, rash, viremia and the production of CHIKV-specific neutralizing antibodies, type I interferon and pro-inflammatory cytokines. CHIKV establishes a persistent infection in NHPs, particularly in cynomolgus macaques (Broeckel, Haese et al. 2015).

Valneva's preclinical data package generated with the CHIKV vaccine candidate demonstrates that a single shot of the CHIKV del5nsP3 vaccine/VLA1553:

- is highly immunogenic and induces a strong and long lasting neutralizing antibody response in a mouse and NHP model;
- protects NHPs from a high-dose wt CHIKV challenge;
- causes no clinical manifestations typically associated with wt CHIKV infections in the NHP model;
- shows a delayed and strongly reduced viremia as compared to wt CHIKV infection in a mouse and NHP model;
- shows strongly reduced cytokine production compared to wt CHIKV infection and
- shows a more sporadic, transient and lower dissemination in tissues of VLA1553 immunized NHPs compared to wt CHIKV infected NHPs;
- confirms the stability of the virus del5nsP3 attenuation in humans post-vaccination;
- is able to protect NHPs from CHIKV infection based on passive transfer of human immune sera to NHPs followed by wt CHIKV challenge and
- shows a negligible risk of VLA1553 virus transmission from vaccinated to non-vaccinated humans by mosquitoes;
- shows substantial neutralizing activity against the wt La Reunion CHIKV as well as against the heterologous strain of the West African lineage using VLA1553-101 post-vaccination samples.

An overview of further non-clinical studies can be found in Table 2 below.

Table 2: Non-clinical Studies with VLA1553

Study	Species	Summary
Repeat-Dose Toxicity	Rabbits (<i>New Zealand Whites</i>)	Upon two high dose vaccinations at a two week interval, all findings were transient and resolved within the 30 days recovery period; No adverse findings.

Persistence of infection and Biodistribution	NHPs (<i>Cynomolgus macaques</i>)	<ul style="list-style-type: none"> › VLA1553 replication in blood was 3 logs lower than replication of wt CHIKV; › shedding of VLA1553 in saliva and vaginal fluids was much lower than wt CHIKV; › in cerebrospinal fluid, synovial fluid and urine, no shedding of VLA1553 nor wt CHIKV was detected; › VLA1553 dissemination in tissues, when detected, was more sporadic, transient and lower than observed for wt CHIKV; › VLA1553 was not detected in joints, muscles or in any of the analyzed brain tissues (encephalon, mesencephalon, cerebellum, plexus choroid). › Cytokine and chemokine profile in VLA1553 showed a lack of strong inflammatory responses compared to wt CHIKV
Mosquito Transmission Study	Mosquitos (<i>Aedes albopictus</i>)	Probability of mosquitoes transmitting VLA1553 virus from a human vaccinated with the vaccine appears to be minisculy low (threshold titer of 3.875 log ₁₀ CCID ₅₀ /mL).
Passive transfer in NHPs using human serum from VLA1553-101	NHPs (<i>Cynomolgus macaques</i>)	After vaccination with VLA1553 a neutralizing antibody titer of ≥50 determined by μPRNT ₅₀ was proposed as a titer reasonably likely to predict protection.

For further details please refer to the Investigator's Brochure.

10.3.2. Clinical Summary

Valneva successfully completed a Phase 1 and two Phase 3 clinical trials. Findings from these clinical trials can be found below.

In a Phase 1 clinical trial (study code: VLA1553-101), three dose levels of VLA1553 were administered i.m. over the deltoid muscle as a single dose immunization. As primary outcome safety and as secondary outcomes immunogenicity and antibody persistence were investigated. 120 healthy volunteers aged 18 to 45 years were randomly assigned 1:1:2 to one of three escalating dose groups (Group L, low 3.2x10³/0.1mL; Group M, medium 3.2x10⁴/1mL or Group H, high dose of 3.2x10⁵ TCID₅₀/1mL) and received a single-shot immunization on Day 0. Half of individuals in all Groups H were re-vaccinated with the highest dose on either Month 6 or 12 and followed up for 28 days post re-vaccination.

The vaccine was generally safe in all and well tolerated in the low and medium dose group. VLA1553 showed an excellent immunogenicity profile in all dose groups after a single vaccination. 100% seroconversion (defined as the proportion of subjects achieving a CHIKV-specific neutralizing antibody titer of NT₅₀ ≥20) was achieved at Day 14 after a single vaccination in all dose groups and sustained at 100% until Month 12. The absence of an anamnestic response following re-vaccination demonstrates that a single vaccination of VLA1553 is sufficient to induce sustaining high titer neutralizing antibodies at all dose levels one year after priming. Even at the Month 12 re-vaccination („intrinsic human viral challenge“)

vaccinees are protected from vaccine induced viremia and associated clinical symptoms as early indication of VLA1553's efficacy at all dose levels. Based on a superior safety along an improved immunogenicity profile in terms of antibody kinetics the medium dose (3.2×10^4 TCID₅₀/1 mL) was selected for further development.

A pivotal Phase 3 trial was performed across 43 U.S. sites (study code: VLA1553-301). The final dose of VLA1553 (target 1×10^4 TCID₅₀/ 0.5 mL) or placebo as control was administered intramuscularly (i.m.) into the deltoid muscle as a single-shot immunization on Day 1 to 4,115 adults, aged 18 years and above. The trial met its primary endpoint inducing protective CHIKV neutralizing antibody titers in 98.9% of participants 28 days after receiving a single shot (264 of 268 subjects from the per-protocol subgroup tested for immunogenicity, 95%CI: 96.7-99.8) and remained high, with 241/246 (98.0%) and 233/242 (96.3%) seroprotected subjects in the VLA1553 arm on Day 85 and Day 180, respectively. The seroprotection rate (SPR) of 98.9% exceeded the 70% threshold (for non-acceptance) agreed with the US FDA. The seroprotective titer was agreed with FDA to serve as a surrogate of protection.

VLA1553 was generally well tolerated among the 3,082 subjects evaluated for safety. An independent Data Safety Monitoring Board (DSMB) continuously monitored the trial and identified no safety concerns. The safety profile was consistent with previous results across all age groups (Lot to lot consistency trial described below and preceding Phase 1 clinical trial) and comparable with other vaccines. The majority of solicited AEs were mild or moderate and resolved within 3 days; 2.0% of subjects reported severe solicited AEs (most commonly fever), thereof 1.8% were assessed as treatment-related by the investigator. Approximately 50% of subjects experienced solicited systemic AEs; headache, fatigue and myalgia were most common (seen in more than 20% of subjects) after vaccination with VLA1553. Approximately 15% of subjects experienced solicited injection site AEs after having received VLA1553. Two SAEs considered related to VLA1553 by the assessing investigators were reported during the entire study period; both subjects received VLA1553, one case of myalgia and one case of syndrome of inappropriate antidiuretic hormone secretion (sponsor assessment: hypovolemic hyponatremia); both cases are completely recovered. In total 11 subjects met the criteria of adverse event of special interest, 10 subjects received VLA1553. Most of the events were mild or moderate, 5 subjects had severe fever. The majority of events were self-limited after 2-4 days. Two subjects had prolonged symptoms: 1) one case recovered, and 2) one case was early termination at Day 51.

The above-described immunogenicity and safety profile was mirrored in the pivotal lot-to-lot consistency trial (trial code: VLA1553-302), where 408 healthy adults were block randomized 1: 1:1 to receive one of three lots of VLA1553. The primary endpoint was met as the Confidence Intervals (CIs) of the Geometric Mean Titer (GMT) ratios of all lots were in the defined

acceptance margins of 0.67 and 1.5. The GMT determined by μ PRNT, peaked at Day 29 with an average titer of 2,643.2; titers subsequently decreased to 846.1 at Day 85 and 708.8 at Day 180. Seroprotection rate was 97.8% (348/356) on Day 29 and remained high, with 321/330 (97.3%) and 316/329 (96.0%) seroprotected subjects on Day 85 and Day 180, respectively, no significant difference between the lots was observed. Moreover, seroconversion rate, defined as a μ PRNT50 titer of ≥ 20 in subjects seronegative at baseline (Day 1), was achieved in 97.5% (353/362) on Day 29 and remained stable throughout the trial, with 327/335 (97.6%) subjects maintaining seroconversion on Day 180.

With regards to safety, after administration of VLA1553, 72.5 % (296/408) of subjects experienced any AE in total. There was no significant difference in any AE occurrences between lots. The majority of AEs at Day 180 were solicited AEs (61%); overall 236 subjects (57.8%) reported solicited AEs assessed to be related to VLA1553 by the Investigator. Furthermore, there were no significant differences in solicited AE occurrences between lots. Overall, AEs were mostly mild or moderate; 16 subjects of 408 (3.9%) experienced 22 severe AEs (8 unsolicited events, 14 solicited events) at Day 180. Five SAEs were reported until Day 180 (met hospitalization criteria); all cases were not related (cases were two of acute appendicitis, one of acute cholecystitis and two miscarriages). Finally, in total one subject met the criteria of adverse event of special interest; the events experienced were mild arthralgia (6 days) and severe fever (3 days) but the events were self-limited.

For further information on study VLA1553-101, VLA1553-301 and VLA1553-302, please refer to the Investigator's Brochure.

10.4 Study Rationale and Justification for Dosage and Study Design

Valneva is developing VLA1553 as a single dose vaccine for prophylaxis of the infection caused by CHIKV. Initially, the safety and seroprotective immunogenicity of VLA1553 was evaluated in a pivotal Phase 3 study in approximately 4,000 adults in comparison to control. The rationale for performing the present study (VLA1555-321) is to additionally evaluate the vaccine candidate VLA1553 in an endemic setting and to assess the safety and immunogenicity of a single dose of VLA1553 with the final adult dose in an adolescent population aged 12 years to <18 years. Subsequently, studies addressing the younger pediatric population <12 years will follow to make the vaccine available to children vulnerable to the disease as fast as possible.

Based on the clinical data for immunogenicity and safety data evaluated up to Day 29 along a favorable DSMB recommendation in the pivotal Phase 3 study, where 3,082 adult subjects received VLA1553, this prospective, randomized, double-blinded, multicenter, pivotal clinical

study will be conducted with the final adult dose of VLA1553 in comparison to a control group in an adolescent population aged 12 to <18 years. This safety and immunogenicity study will be used to establish the safety database and provide pivotal immunogenicity data in adolescents for licensure.

10.4.1 Selection of Study Population

A total of approximately 750 male and female subjects aged 12 years to <18 years residing in an endemic area for CHIKV, who meet all inclusion criteria and none of the exclusion criteria and provide a written informed consent/assent, will be invited to participate in the study. Subjects will be screened by ELISA for evidence of previous CHIKV exposure and will subsequently be stratified by CHIKV baseline serostatus in approximately 20% seropositive and 80% seronegative subjects.

In addition, this study aims to include subjects with underlying other viral infections in an endemic setting to evaluate the effect of VLA1553 vaccination on preexisting antibodies against other alpha- and arboviruses. Previously, a clinical study evaluated immunological interference from sequential administration of vaccines against heterologous alphavirus (i.e. Venezuelan equine encephalitis virus and CHIKV). Preexisting alphavirus immunity interfered with subsequent neutralizing antibody responses to a live-attenuated heterologous vaccine (McClain et al. 1998).

10.4.2 Selection of Seroprotective Threshold

Human immune sera derived from individuals of the Phase 1 clinical study (VLA1553-101) with different titers were passively transferred to NHPs to assess protection from viral replication after challenge with a high dose of wt CHIKV LR2006- OPY1. The challenge dose used for this study (7,000 to 10,000 PFU) corresponds to a dose that is higher than the dose people may encounter when bitten by a mosquito (Dubrulle et al. 2009).

The study revealed, that the animals were fully protected against viremia by using the highest dose of human immune sera (Day 28, titer range 82-155 μ PRNT₅₀). In addition, a highly significant decrease of viral RNA based on RT-qPCR was noted, of 3 to 5 logs, compared to the control animals. The duration of viremia was also strongly reduced from more than 10 days in control animals to 2-3 days in animals treated with human VLA1553-101 serum, except for 2 animals treated with the ultra-low serum pool (5 days).

Most importantly, the NHP passive transfer study showed that all human VLA1553-101 serum treated animals with μ PRNT₅₀ titers between 10 and 155 prior to challenge were fully protected against CHIKV infection-associated fever or modification of blood parameters. The threshold for protection (lowest observed Day 0 titer at which at least 90% of animals are protected from viremia) was 52.

When comparing the protection against CHIKV infection provided by the human sera of Day 180 post-immunization with the data of the Day 28 (or Day 14 and 84) sera, our analysis showed there is no significant difference in terms of viremia or protection at the same level of μPRNT_{50} titer prior to challenge.

Therefore, a neutralizing antibody titer of $\mu\text{PRNT}_{50} \geq 150$ was agreed as a titer reasonably likely to predict protection.

10.5 Evaluation of Anticipated Risks and Benefits of the Investigational Product(s) to Human Subjects

10.5.1 Possible Benefits for Subject

The benefit of participation for the subjects in this study is the possible formation of antibodies against CHIKV after vaccination with the VLA1553 candidate vaccine (among those not in the control group). During their participation in this study, the subjects' antibody development will be monitored. Following vaccination with Valneva's VLA1553 vaccine, subjects may acquire immunity to CHIKV as indicated by antibody levels above the pre-defined threshold indicative of protection.

Based on the results of non-clinical studies and epidemiological data it is anticipated that a substantial number of subjects will be protected against CHIKV infection following participation in the study. In addition, recent data of a pivotal Phase 3 study conducted in 3082 adults showed that almost all participants receiving VLA1553 developed high levels of antibodies against CHIKV. However, subjects living in CHIKV endemic areas should be counseled to apply personal protective measures against mosquito bites.

Another benefit for subjects involved in this study is derived from safety monitoring and follow-up as prophylactic measure for an early diagnosis of illness.

If VLA1553 is proven to be safe and effective, it will be offered to the control group at the end of the study if approved by Brazilian regulatory authorities.

10.5.2 Possible Benefits for Society

CHIKV is currently regarded as one of the most-likely re-emerging viruses to spread globally (Simon, Savini et al. 2008), an issue which raises an urgent demand for efficient prophylaxis. However, at present there is no treatment or vaccine available against this CHIKV-induced debilitating disease and its various symptoms (Ahola et al. 2015; Weaver et al. 2012; Weaver and Lecuit 2015). Thus, morbidity due to this virus is a serious threat to global health and CHIKV has now been listed as a priority pathogen by the National Institutes of Allergy and

Infectious Disease (NIAID) in the United States (Ahola, Couderc et al. 2015; Weaver and Lecuit 2015; NIAID October 26, 2016). Due to the increasing frequency and risk of CHIKV, the development of a safe and effective vaccine is a high priority. Consequently, the availability of a vaccine which can also be used in the adolescent population and subsequently in infants below 12 years of age, is highly anticipated.

Through the participation in this Phase 3 study, the subjects will contribute to the development of a novel vaccine against chikungunya. This study is part of a complete clinical development program, which is intended to lead to subsequent licensure of the VLA1553 vaccine, if it is shown to be safe and efficacious.

The study will also aim to evaluate the incidence of CHIKV infections with onset 14 days post-vaccination for the entire study period indicative of the vaccine's efficacy. Further, since little is known about CHIKV disease in children the study aims to accumulate data of clinical signs and symptoms in this population following vaccination on Day 1 for the entire study period. This will not only provide further information for subsequent pediatric clinical studies but also inform the management of CHIKV disease in children in general.

10.5.3 Possible Risks / Inconveniences for the Subject

VLA1553 is a live-attenuated vaccine where the attenuation of the virus leads to a reduced replication capability of the vaccine. Thus, as demonstrated in preclinical studies, viremia was delayed and strongly reduced and no clinical manifestations typically associated with wt CHIKV infections occurred in non-human primates. Viremia was observed in some subjects in the Phase 1 study albeit short-lived and greatly reduced from levels observed after natural infection. Only a single subject shed virus in urine.

Overall, the vaccine was well-tolerated in a healthy adult population aged 18 years and above following a single vaccination.

In the recent phase 3 study VLA1553-301 solicited systemic reaction rates were reported in 49.6% of subjects. The most frequently reported symptoms of related systemic reactions were headache (27.4 %), fatigue (25.4 %) and myalgia (21.7 %). The majority of reactions were transient and of mild or moderate severity. The most common solicited local reactions were tenderness (10.4%) and pain (6.1%) after vaccination with VLA1553. Most of solicited local AEs were mild, one severe event of pain was reported.

Overall, 2 related SAEs were reported in VLA1553-301: (1) myalgia and (2) SIADH. The investigator and nephrologist diagnosed SIADH which appeared to be related to prolonged fever/symptoms after vaccination. Both events resolved completely. In addition, in 10 out of 3082 subjects receiving VLA1553 the AESI criteria were met: 5 subjects reported fever in combination with arthralgia, 3 subjects reported fever together with back pain and 2 subjects

reported fever, arthralgia, and back pain. However, most of the symptoms contributing to an AESI were mild or moderate, 3 subjects had severe fever. The majority of the symptoms were self-limited after 2-4 days, for two cases no end date was available at time of data snapshot.

In Phase 1, similar rates of solicited AEs were reported. Contrary to Phase 1 data where transient changes in blood cell counts were reported as AEs in a third of participants after a single vaccination, neutropenia was observed in approximately 6.2% subjects only.

Allergic reactions to components of the vaccine or - in the worst case – an anaphylactic shock cannot be excluded, although such reactions have been reported in very rare cases with other vaccinations.

The possibility that vaccination may activate an autoimmune disease (e.g., multiple sclerosis) in predisposed subjects cannot be excluded.

In addition, as with any IMP, there may be unforeseeable risks associated with the use of the VLA1553 vaccine.

The blood draws performed during the study carry the possible risks of pain, hematoma, and in very rare cases an infection at the venipuncture site. The process of vaccination may also trigger syncope.

For further details on known and potential risks of this investigational product, please refer to the Investigator's Brochure.

10.6 COVID-19 Management

The ongoing COVID-19 pandemic may impact the conduct of this clinical study. Therefore, the study Sponsor will continuously monitor and evaluate the development of the COVID-19 pandemic in the area of the study sites.

The safety of the subject has highest priority. The study Sponsor will modify the study conduct accordingly, if any potential safety issues arise. These decisions may include halting trial recruitment or the change of subject monitoring during the study. In all cases, the subject and/or the legal representative(s) will be informed.

To protect the subject's safety, welfare, and rights, the study Sponsor will continuously evaluate specific circumstances, such as the ability to conduct appropriate safety monitoring or the potential impact on the IMP supply chain.

Depending on the local situation, subjects may not be able to come to the site for protocol-specified visits. Therefore, existing processes will be modified or new processes will be implemented. Such modifications include, but are not limited to, alternative methods of safety assessments (e.g. switching in-person visits to phone calls or virtual visits, or alternative

location for assessment, including local labs) or employ mobile teams to collect serum samples. In all cases, the subject and/or the legal representative(s) will be informed.

To mitigate risks to the subjects or in response to local governmental recommendations further recruitment can be temporarily halted or some assessments will be delayed. All alternative processes will be consistent with the protocol to the extent possible.

Changes in study visit schedules, missed visits or subject discontinuations due to COVID-19 will be recorded. In addition, the reason for the implementation of any contingency measures will be documented.

Moreover, the Sponsor will communicate any measures or modifications of the study protocol to the relevant CA and IRB in line with local requirements.

The COVID-19 measures are based on the FDA Guidance on Conduct of Clinical Trials of Medical Products during COVID-19 Public Health Emergency (as of 02-July-2020) and will be adjusted, if needed.

11. STUDY PURPOSE AND OBJECTIVES

11.1 Study Purpose

To verify the safety and immunogenicity of the final adult dose (1×10^4 TCID₅₀ per 0.5ml) of the live-attenuated CHIKV vaccine candidate (VLA1553) in adolescents aged 12 years to <18 years after a single immunization.

To evaluate the proportion of subjects with neutralizing antibody titers above a threshold indicative of protection as derived from animal passive transfer experiments.

To assess the immunogenicity and safety of VLA1553 in CHIKV seropositive subjects.

11.2 Primary Objective

The primary objective is to evaluate the immunogenicity and safety of the adult dose of the live-attenuated CHIKV vaccine candidate (VLA1553) 28 days following vaccination in adolescents aged 12 years to <18 years after a single immunization.

11.3 Secondary Objectives

The secondary objectives are to assess the immunogenicity and safety up to Month 12 of the adult dose of VLA1553 following vaccination in adolescents aged 12 years to <18 years after a single immunization.

In addition, the immunogenicity and safety of VLA1553 in subjects previously exposed to CHIKV will be assessed.

11.4 Exploratory Objectives

The exploratory objective is to evaluate the efficacy of VLA1553 in adolescents aged 12 years to <18 years after a single immunization.

In addition, information on the CHIKV disease clinical spectrum and associated risk factors in an adolescent population will be collected.

12. STUDY DESIGN

12.1 Overall Study Design

This is a multicenter, prospective, randomized, double-blinded, pivotal clinical study evaluating the adult dose (1 x10E4 TCID₅₀ per 0.5 mL) of VLA1553 in comparison to control. VLA1553 and control will be administered as single immunization on Day 1. Overall, 750 male and female subjects aged 12 years to <18 years will be enrolled (i.e. ICF/assent signed) in the study, stratified by ELISA baseline serostatus: 20% seropositive and 80% seronegative for CHIKV.

As safety precaution, the study will be initiated with an age de-escalation of sentinel cohorts. Enrollment will start with 30 sentinel subjects from Cohort I (15 to <18 years) that will allow the generation and review of safety data before enrollment of sentinel subjects from Cohort II (12 to <15 years) is initiated. Age de-escalation will only be conducted if the safety profile is considered favorable^{viii}. Enrollment will be performed in an age-descending, staggered manner for the two age cohorts (see Figure 12.1- 2).

Subjects will be randomized in a 2:1 ratio to VLA1553 (n= 500) or control group (n= 250). Approximately 385 subjects will be randomized to the immunogenicity subset^{ix}. Thereof, approximately 75 subjects will constitute the viremia subset.

The study design is outlined in Figure 12.1- 1.

Table 3 below illustrates the subject groups and study subsets.

Study Groups	Treatment	Number of subjects (n)	Immunogenicity (Viremia) Subset (n)
Study Arm 1	VLA1553^a	500	335 (50)
<i>Seropositive by ELISA</i>		<i>100</i>	<i>67 (10)</i>
<i>Seronegative by ELISA</i>		<i>400</i>	<i>268 (40)</i>
Study Arm 2	Control	250	50 (25)
<i>Seropositive by ELISA</i>		<i>50</i>	<i>10 (5)</i>
<i>Seronegative by ELISA</i>		<i>200</i>	<i>40 (20)</i>
Total N		750	385 (75)

^{viii} None of the DSMB review criteria as outlined in Section 12.1.2 are met.

^{ix} All sentinel subjects of Cohort I and Cohort II will be allocated to the Immunogenicity subset.

^a dose used for Phase 3 trials in adults

All subjects will return to the study site at Day 8 (Visit 2), Day 29 (Visit 3), Month 3 (Day 85, Visit 4) and Month 6 (Day 180, Visit 5) for safety evaluations and immunogenicity sampling. At Day 1 (Visit 1), immunogenicity analysis will be performed for all subjects for stratification by baseline μ PRNT serostatus. Thereafter, immunogenicity analysis and evaluations will only be done in the immunogenicity subset. Subjects in the viremia subset will have viremia samples collected at Visits 1, 2 and 3. Samples from Visit 1 and 2 will be analyzed. The collected viremia sample of Visit 3 will only be analyzed if sample of Visit 2 is positive. In addition, for clinically indicated retrospective analysis viremia samples will be collected throughout the study from ALL subjects. Safety data collection will capture all AEs up to Month 6 (Visit 5).

After Day 180 (Visit 5), AE collection will be limited to SAEs.

Subjects from the immunogenicity subset will also return to the study site at Month 12 (Day 365, Visit 6) for collection and assessment of immunogenicity samples. In addition, a clinical sample for safety laboratory evaluations will be obtained at all study visits from the immunogenicity subset only.

The overall study design is displayed in the **Figure 12.1- 1** below.

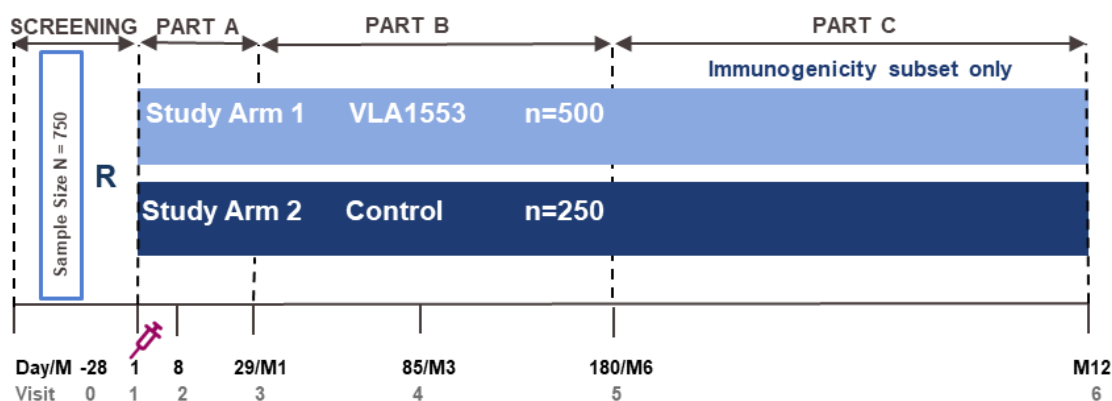

Figure 12.1- 1 Adolescents Pivotal Clinical Study Design.

M = month;

If VLA1553 is proven to be safe and effective, it will be offered to the control group at the end of the study if approved by Brazilian regulatory authorities.

12.1.1 Subject Enrollment

As a safety precaution, the study will be initiated with an age de-escalation of sentinel cohorts as described in Figure 12.1- 2. Subjects will be recruited in two cohorts as follows:

Cohort I (15 to <18 years):

The enrollment will start with 30 sentinel subjects aged 15 to <18 years (Cohort I). Subjects will be randomized 2:1 to receive VLA1553 or control. Specifically, a maximum of 10 sentinels will be vaccinated per day and observed at the study site for one hour after vaccination for safety and reactogenicity. If no immediate safety concerns arise as determined by the Investigator, the next sentinels of this Cohort will be vaccinated and observed for one hour. If the safety profile is considered favorable^x by the principal investigator of the study site vaccinating the sentinel subjects and Sponsor, enrollment of Cohort II (12 to <15 years) can be initiated. If at any time during the sentinel recruitment the DSMB review criteria are met (as outlined in 12.1.2), vaccinations will be halted for the sentinels and only be continued after DSMB review. All sentinels of Cohort I are to return to the study site 7 days post-vaccination for safety follow-up (Visit 2). If no DSMB review criteria (as described in 12.1.2) are met after all 30 sentinels have been vaccinated, enrollment of subjects of Cohort I will continue without DSMB review.

Cohort II (12 to <15 years):

The enrollment will start with 30 sentinel subjects aged 12 to <15 years (Cohort II). Subjects will be randomized 2:1 into VLA1553 or control. Specifically, a maximum of 10 sentinels will be vaccinated per day and observed at the study site for one hour after vaccination for safety and reactogenicity. If no immediate safety concerns arise as determined by the Investigator, the next sentinels of this Cohort will be vaccinated and observed for one hour. If at any time during the sentinel recruitment the DSMB review criteria are met (as outlined in 12.1.2), vaccinations will be halted for the sentinels and only be continued after DSMB review. All sentinels of Cohort II are to return to the study site 7 days post-vaccination for safety follow-up (Visit 2). If no DSMB review criteria (as described in 12.1.2) are met after all 30 sentinels have been vaccinated, enrollment of subjects of Cohort II will continue without DSMB review.

^x None of the DSMB review criteria as outlined in Section 12.1.2 are met.

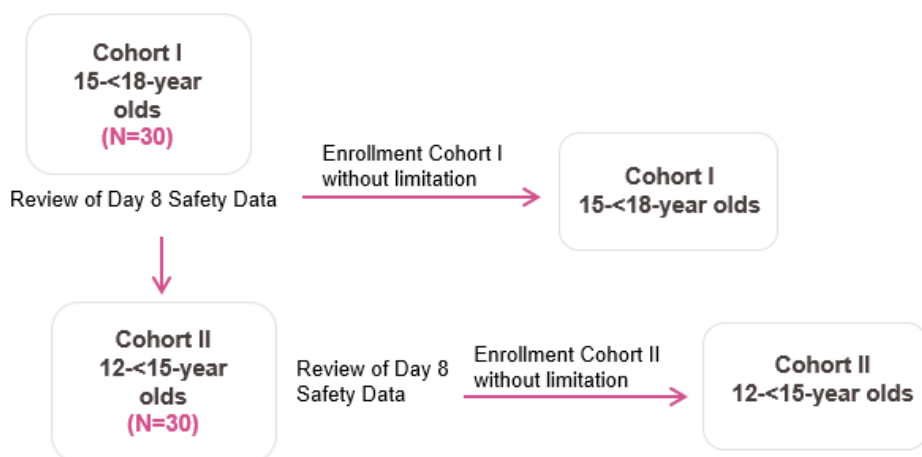

Figure 12.1- 2 Subject Enrollment Process

12.1.2 DSMB Review Criteria

Following criteria trigger a DSMB meeting along with a favorable recommendation by the DSMB prior to further vaccinations:

- **One** or more subjects experience an SAE with no likelier alternative cause than the study vaccine (i.e. possibly or probably related);
- **Three** or more subjects experience the same Grade 3 (severe) solicited injection-site reaction that (1) occurs within 7 days following vaccination and (2) lasts longer than 3 days;
- **Three** or more subjects experience the same Grade 3 (severe) solicited systemic reaction that (1) occurs within 7 days following vaccination, (2) lasts longer than 3 days, and (3) has no likelier alternative cause than the study vaccine;
- **Three** or more subjects experience the same Grade 3 (severe) unsolicited AE, including Grade 3 abnormal laboratory values that are assessed to be clinically relevant by the Investigator, that (1) occurs within 7 days after vaccination, and (2) has no likelier alternative cause than the study vaccine.

12.2 Study Duration

The overall study duration (First Subject In – Last Subject Out) is estimated to be approximately 15 months.

Individual subject participation is approximately 7 months or 13 months (immunogenicity subset) from enrollment to study completion, unless prematurely discontinued.

12.3 Study Endpoint

12.3.1 Primary Endpoint

The primary endpoint is to assess the proportion of subjects with a seroprotective CHIKV antibody level defined as $\mu\text{PRNT}_{50} \geq 150$ for μPRNT baseline negative subjects 28 days post-vaccination.

12.3.2 Secondary Endpoints

Immunogenicity

The following secondary immunogenicity endpoints will be evaluated:

- Immune response as measured by CHIKV-specific neutralizing antibody titers on Day 8, Day 29, Day 85, Day 180, and Month 12 post-vaccination as determined by μPRNT assay;
- Proportion of subjects with seroprotective levels (defined as $\mu\text{PRNT}_{50} \geq 150$ for baseline negative subjects)ⁱⁱ on Day 8, Day 85, Day 180 and Month 12 post-vaccination as determined by μPRNT assay;
- Proportion of subjects with seroconversion^{iv} as compared to baseline at Day 29, Month 6 and Month 12 as determined by μPRNT assay;
- Fold increase of CHIKV-specific neutralizing antibody titers determined by μPRNT assay at Days 8, 29, 85, 180 and at Month 12 post-vaccination as compared to baseline;
- Proportion of subjects reaching an at least 4-fold, 8-fold, 16-fold or 64-fold increase in CHIKV-specific neutralizing antibody titer compared to baseline as measured by μPRNT assay;
- Antibody titers, seroprotection and fold increases for CHIKV-specific neutralizing antibodies, determined by μPRNT assay at Days 1, 8, 29, 85, 180, and Month 12 post-vaccination stratified by μPRNT baseline serostatus.

ⁱⁱ Seroprotective threshold derived from animal passive transfer experiments.

^{iv} Seroconversion defined as a >4-fold increase of μPRNT_{50} compared to baseline (Day 1).

Safety

The following secondary safety endpoints will be determined:

- Frequency and severity of unsolicited AEs until Day 29 and Month 6 post-vaccination;
- Frequency and severity of solicited injection site and systemic reactions within ten days post-vaccination;
- Frequency and relatedness of any serious adverse event (SAE) during the entire study period;
- Frequency and severity of any early onset adverse event of special interest (AESI) starting within 2 to 21 days post-vaccination (i.e. Day 3 – Day 22);
- Frequency and severity of any late onset adverse event of special interest (AESI) during the entire study starting 22 days post-vaccination (i.e. Day 23 – study end).
- Assessment of viremia on Days 1 and 8 (and Day 29, if applicable) after vaccination.

12.3.3 Exploratory Endpoints

- Incidence of CHIKV infections with onset 14 days post-vaccination as evidenced by viremia by virus specific RT-qPCR, clinical diagnosis and seroconversion by μ PRNT for the entire study period;
- Accumulate data of CHIKV disease signs and symptoms in adolescent population as assessed following vaccination on Day 1 for the entire study period.

12.4 Randomization and Blinding

The 750 male and female adolescent subjects will be randomized in a 2:1 ratio to VLA1553 or control group as described in Section 12.1.

In order to minimize/avoid bias, assignment into one of these study arms will be blinded for the subjects and the site staff performing the safety assessments as well as the biostatistician (i.e. double-blind).

Each subject will have a unique subject screening number obtained via the interactive response technology (IRT) and assigned at the screening visit. The Investigator will keep a record (i.e. the subject screening log) of subjects who entered screening.

Randomization will be performed via the IRT. At Day 1 (Visit 1, Day of vaccination) eligible subjects will be assigned to VLA1553 or control. Each subject will receive a unique randomization number when he/she is assigned to the study arm. Subjects will be allocated to study arms according to the randomization code.

The IMP will be prepared by unblinded study staff in accordance with the information in the IRT.

An overview of persons who will be (un)blinded is provided below:

Unblinded:

- Designated study staff who randomize subjects to study arms and are concerned with IMP handling (i.e. perform preparation of the study vaccine, maintain the drug dispensing log detailing the dates and quantities of IMP administered to each subject). The unblinded study staff will not be involved in any other study procedures/assessments;
- CRA's responsible for monitoring of IMP handling and for verifying drug accountability during the study and performing overall drug accountability;
- DSMB voting members;
- Bio-statistician preparing unblinded analysis for the DSMB.

Blinded:

- Investigators and other study staff involved in general study conduct and safety assessments;
- Study participant;
- Bio-statistician (except the one involved in DSMB);
- CRA's responsible for monitoring study data;
- All laboratory personnel at central and local laboratories for safety and immunogenicity laboratory assessments;
- All other Sponsor and CRO staff including medical monitor and laboratory personnel at the Sponsor's labs for additional testing procedures.

In addition, IMP administration (i.e. vaccination of subjects) can be performed by either unblinded or blinded study staff.

12.4.1 Blinding Process

In order to ensure the blinding of study participants and site staff performing the safety assessments with respect to the vaccine dose, preparation of IMP must be done by unblinded staff members in a separate room applying the 4-eyes principle, unobserved by blinded staff members and the subject.

The syringe is provided to the sites already in a masked manner. Content in the syringe is masked by a yellow tint, transparent adhesive label wrapped around the syringe. The unblinded study staff must not discuss randomizations with study clinicians and will not be involved in any other study related procedures/assessments. Identification of the syringe is guaranteed by placing a tear-off label containing Kit number, Subject number date of injection and operator onto the label.

For further details please refer to the IMP Manual.

12.4.2 Unblinding

The randomization assignment is not to be revealed except in emergency cases in which unblinding is necessary for the clinical management of an SAE. In such events, Investigator must either inform the Sponsor before breaking the blind or immediately after unblinding has been performed.

In case of emergency, the vaccine administered to the subjects can be revealed through the IRT.

12.5 Study Termination - Study Stopping Rules

The study may be paused or prematurely terminated, after consultation with the DSMB, if vaccine-related SAEs or other significant vaccine-related side effects occur. In addition, the Sponsor may stop the entire study for any reason at any time.

If the Sponsor or Investigator decides to terminate the study before it is completed, they will notify each other in writing, stating the reasons for early termination. In terminating the study, the Sponsor and the Investigator will ensure that adequate consideration is given to the protection of the subjects' interests. The Sponsor or Investigator will notify the relevant regulatory authorities or IRB in writing in accordance with local requirements. Documentation will be submitted for filing in the Investigator File and the Trial Master File.

13. SUBJECT SELECTION, WITHDRAWAL AND DISCONTINUATION

Approximately 750 adolescents of either gender, who satisfy the inclusion and exclusion criteria listed below, will be invited to participate in the study.

13.1 Inclusion Criteria

Subjects who meet **ALL** of the following criteria are eligible for this study:

1. Male or female adolescents aged 12 years to <18 years^{xi} at the time of vaccination;
2. Written informed consent by the subject's legal representative(s), according to local requirements, and written informed assent of the subject, if applicable;
3. Subject is generally healthy^{xii} as determined by the Investigator's clinical judgement based on medical history, physical examination and screening laboratory tests;
4. Subject is seropositive for previous CHIKV exposure (i.e. IgM+/IgG+ or IgM-/IgG+) or seronegative (i.e. IgM-/IgG-) as screened by CHIKV-specific ELISA^{xiii}.
5. If subject is of reproductive potential: :
 - a) Subject has practiced an adequate method of contraception during the 30 days before screening (Visit 0);
 - b) Subject has a negative serum or urine pregnancy test at screening (Visit 0) or Day 1 (Visit 1), respectively.
 - c) Subject agrees to employ adequate birth control measures for the first three months post-vaccination (i.e. until Day 85, Visit 4). This includes one of the following measures:
 - Hormonal contraceptives (e.g. implants, birth control pills, patches);
 - Intrauterine hormone-release systems;
 - Barrier type of birth control measure (e.g. condoms, diaphragms, cervical caps);
 - Vasectomy in the male sex partner \geq 3 months prior to first vaccination.
 - Sex abstinence;
 - Same-sex relationships.

^{xi} From the 12th birthday to the last day before the 18th birthday

^{xii} Subjects are considered **generally healthy** if (1) any chronic illness/condition, e.g. hypertension, type 2 diabetes mellitus, or hyperlipidemia is stable and well-controlled on therapy for the past 6 months, and (2) they do not have a disease that is identified as an exclusion criterion.

^{xiii} Subjects who are IgM+/IgG- do not qualify for participation in this study.

13.2 Exclusion Criteria

Subjects who meet **ANY** of the following criteria are **NOT** eligible for this study:

1. Subject is taking medication or other treatment for unresolved symptoms attributed to a previous CHIKV infection; or has participated in a clinical study involving an investigational CHIKV vaccine;
2. Subject has an acute or recent infection (and who is not symptom-free in the week prior to the Screening Visit (Visit 0);
3. Subject tests positive for human immunodeficiency virus (HIV), hepatitis B surface antigen (HBsAg) or hepatitis C virus (HCV);
4. Subject has received another live virus vaccine within 28 days or inactivated vaccine within 14 days prior to vaccination in this study or plans to receive a live-virus vaccine within 28 days or inactivated vaccine within 14 days after vaccination, respectively;
5. Subject has abnormal findings in any required study investigations (including medical history, physical examination, and clinical laboratory) considered clinically relevant by the Investigator which pose a risk for participation in the study based on his/her judgement;
6. Subject has a medical history of or currently has acute or progressive, unstable or uncontrolled clinical conditions (e.g. cardiovascular, respiratory, neurologic, psychiatric, or rheumatologic conditions) that poses a risk for participation in the study, based on Investigators clinical judgement. Examples include individuals with poorly controlled or unstable disease, ongoing suspected or active inflammation, or poor compliance with pharmacologic treatment, or presence of high-risk comorbidities (e.g. significant cardiopulmonary disease);
7. Subject has a history of immune-mediated or clinically relevant arthritis/arthritis;
8. Subject has a history of malignancy in the past 5 years other than squamous cell or basal cell skin cancer. If there has been surgical excision or treatment more than 5 years ago that is considered to have achieved a cure, the subject may be enrolled. A history of hematologic malignancy is a permanent exclusion. Subjects with a history of skin cancer must not be vaccinated at the previous tumor site;
9. Subject has a known or suspected defect of the immune system that can be expected to influence the immune response to the vaccine, such as subjects with congenital or acquired immunodeficiency, including infection with HIV, status post organ transplantation or immuno-suppressive therapy within 4 weeks prior to Visit 1. Immuno-suppressive therapy is defined as administration of chronic (longer than 14 days)

prednisone or equivalent ≥ 2 mg/kg/day within 4 weeks prior to study entry, radiation therapy or immunosuppressive cytotoxic drugs/ monoclonal antibodies in the previous 3 years; topical and inhaled steroids are allowed.

10. Subject has a history of any vaccine related contraindicating event (e.g., anaphylaxis, allergy to components of the candidate vaccine, other known contraindications);
11. Subject presents with clinical conditions representing a contraindication to intramuscular vaccination and blood draws;
12. Subject is pregnant (positive serum or urine pregnancy test at screening or Visit 1, respectively), has plans to become pregnant or subject's female partner plans to become pregnant during the first three months post-vaccination or subject is lactating at the time of enrollment;
13. Subject has received blood-derived products (e.g. plasma) within 90 days prior to vaccination in this study or plans to use blood products until Day 180 of the study.
14. Subject has a rash, dermatological condition or tattoos that would, in the opinion of the Investigator, interfere with injection site reaction rating;
15. Subject has a known or suspected problem with alcohol or drug abuse as determined by the Investigator;
16. Subject has any condition that, in the opinion of the Investigator, may compromise the subject's well-being, might interfere with evaluation of study endpoints, or would limit the subject's ability to complete the study;
17. Subject is committed to an institution (by virtue of an order issued either by the judicial or the administrative authorities);
18. Subject has participated in another clinical study involving an investigational medicinal product (IMP) or device within 30 days prior to study enrollment or is scheduled to participate in another clinical study involving an IMP, or device during the course of this study;
19. Subject is a member of the team conducting the study or in a dependent relationship with one of the study team members. Dependent relationships include close relatives (i.e., children, partner/spouse, siblings, parents) as well as employees of the Investigator or site personnel conducting the study.

13.3 Delay Criteria

Vaccination will be delayed if:

1. Subject has an acute febrile infection within 72 hours prior to the scheduled vaccination or axillary temperature greater than or equal 37.8°C on the day of vaccination. Subject may be rescheduled within the screening visit window provided that the illness has resolved (72 hours without fever);
2. Subject has received antipyretics within 4 hours prior to the scheduled time of vaccination. Subject may be rescheduled within the screening visit window.
3. Subject has received any live or inactivated vaccine within 28 days or 14 days prior to vaccination, respectively.
4. IMP is unavailable at the site (e.g.: logistics problems) or under quarantine*.
5. In case of no blood sample result available (e.g. out of stability samples) due to logistical problems at Screening (V0), and the permission of at least one legal representative to recollect the missing sample*.

In addition, for a rescheduled vaccination all inclusion and none of the exclusion criteria must be met; in case not all of these criteria are met, the subject will be excluded from the study.

The rescheduled visit should be within the specified time window for the vaccination visit. In case the time window for the rescheduled visit cannot be met, the subject might be invited for a re-screening.

* To respect the subjects right to participate in this study, these criteria are implemented by the sites after receiving local IRB approval. The description of the entire process is documented in the source documents by the investigator, since these delay criteria were not included in the previous version of the clinical study protocol. Additionally, for recollection of a blood sample the permission of at least one legal representative has to be documented in the source documents and is only allowed once.

13.4 Pregnancy Testing and Birth Control

The risk of maternal-to-fetal transmission of chikungunya vaccine virus during pregnancy and transmission of CHIKV via semen cannot be excluded. Therefore, only female subjects of childbearing potential presenting with a negative pregnancy test and subjects of both gender practicing the use of adequate birth control before conduct and during the first three months of the study are eligible for inclusion into the study. A female subject is considered of childbearing potential after onset of menarche.

Subjects of reproductive potential must have practiced an adequate contraceptive method during the 30 days before Visit 0 (Screening Visit) and the first three months after vaccination (until Visit 4, Month 3).

Female subjects must present with a negative **serum** pregnancy test at Visit 0 (Screening Visit) and a negative **urine** pregnancy test prior to vaccination. In addition, a **urine** pregnancy test will need to be performed at the Early Termination Visit (if applicable), on Visit 3 and on a monthly basis between Visits 4 and 5 and between Visits 5 and 6. Subjects will document the results of the monthly pregnancy tests in a pregnancy diary (see Section 17.5).

Subjects of reproductive potential are required to practice an acceptable method of birth control for the first three months post-vaccination. Contraceptive methods will be provided by the Sponsor. An acceptable method of birth control is defined as those, which result in a low failure rate (i.e. less than 2% per year) when used consistently and correctly.

This includes one of the following measures:

- Hormonal contraceptives (e.g. implants, birth control pills, patches);
- Intrauterine hormone-releasing system;
- Barrier type of birth control measure (e.g. condoms, diaphragms, cervical caps);
- Vasectomy in the male sex partner ≥ 3 months prior to first vaccination;
- Sexual abstinence;
- Same-sex relationships;
- Not to be of reproductive potential, such as having undergone hysterectomy, bilateral oophorectomy, tubal ligation, or vasectomy.

Subjects without reproductive potential are not required to perform any birth control measure. A male subject is considered of non-reproductive potential if he has undergone vasectomy. A female subject is considered of non-reproductive potential, if she is:

- Before onset of menarche;
- Surgically sterilized for ≥ 3 months prior to Visit 1 (permanent sterilization methods include hysterectomy, bilateral salpingectomy or bilateral oophorectomy, or transcervical sterilization (Essure and Adiana procedures).

Study site staff should continuously reassess reproductive potential during the study.

If a subject or his female partner becomes pregnant during the study, the subject/legal representative(s) must immediately inform the Investigator. The subject is asked to attend all remaining visits according to schedule.

13.5 Subject Withdrawal or Discontinuation

Any subject has the right to withdraw from the study at any time for any reason, without the need to justify. The Investigator and Sponsor also have the right to prematurely terminate a subject's further participation in the study, e. g. in the case of non-compliance or if – in the judgment of the Investigator and/or Sponsor – continued participation would pose an unacceptable risk for the subject.

The primary reason for withdrawal / discontinuation of a subject from treatment and/or from the study should be documented in the electronic Case Report Form (eCRF) (e.g. withdrawal of consent, Investigator/Sponsor recommended withdrawal, lost to follow-up, death).

The primary reasons for discontinuation will be reported on the Discontinuation eCRF, including:

- Withdrawal of consent (not due to AE);
- Withdrawal due to AE;
- Lost to follow-up (defined as 3 documented unsuccessful attempts to contact the subject^{xiv});
- Investigator decision (e.g. non-compliance with protocol);
- Study terminated by Sponsor;
- Death;
- Or other (reason to be specified by the Investigator, e.g. technical problems).

Regardless of the reason, all data available for the subject up to the time of completion/discontinuation should be recorded on the appropriate CRF.

Data collected on withdrawn subjects will be used in the analysis and included in the clinical study report.

Subjects who do not complete the entire study due to withdrawal or discontinuation for any reason will not be replaced.

^{xiv} **Note** that a subject who is lost to follow-up but later returns to the study site for a follow-up can still complete the study provided he/she has received the vaccination according to the protocol.

14. INVESTIGATIONAL MEDICINAL PRODUCT

14.1 Description of VLA1553

The CHIKV vaccine (VLA1553) is a live-attenuated vaccine comprising a large deletion of 60 amino acids in the nsP3 gene encoding the non-structural replicase complex protein nsP3, which leads to attenuation of the virus *in vivo*.

VLA1553 is present in a freeze dried presentation and must be reconstituted with a solvent consisting of sterile water for injection in a prefilled syringe before use.

One dose (0.5 mL) of the VLA1553 vaccine contains between 1.6×10^3 and 2.5×10^4 TCID₅₀ per dose. The active ingredient is suspended in a formulation buffer of pH 7.3, before freeze drying.

Table 14.1-1 Composition of the VLA1553 lyophilized Drug Product	
Active substance	
Live-attenuated CHIKV	Target TCID ₅₀ /dose
	1x 10E4 TCID ₅₀
Excipients and buffer components	Freeze Dried Formulation/ dose
di-Potassium Hydrogen Phosphate	0.313 mg
Potassium di-Hydrogen Phosphate	0.098 mg
Trisodium citrate dihydrate	3.68 mg
Sucrose	25 mg
Magnesium Chloride hexahydrate	0.51 mg
D-Sorbitol	2.5 mg
L-Methionine	0.75 mg
Recombinant Human Albumin	0.01% (equals 0.05mg)
pH	7.3

14.2 Description of Placebo

VLA1553 Placebo consists of a PBS buffer based on Dulbecco's PBS media formulation without Calcium and Magnesium. The concentration of the PBS is 1x and is produced with raw material classified as free from animal origin. The filling volume is 0.6 mL, ensuring an extractable volume of 0.5 mL. The glass vials are 2R Type I Plus® glass vials closed with 13 mm injection Flurotec® secured by aluminum crimp caps.

Table 14.2-1 Composition of Placebo	
Ingredient	Concentration per dose (0.5 mL)
Potassium Chloride (KCl)	100 µg
Potassium Dihydrogen phosphate (KH ₂ PO ₄)	100 µg
Sodium Chloride (NaCl)	4000 µg
Di Sodium Hydrogen Phosphate Heptahydrate (Na ₂ HPO ₄ x7H ₂ O)	1080 µg

14.3 IMP Packaging

14.3.1 VLA1553 Packaging

VLA1553 will be provided in kit containing one single-use 2R vial with the lyophilized powder of VLA1553 vaccine, one solvent consisting of 0.5 mL sterile water for injection in a prefilled syringe and a sterile needle set (i.e. 2x 25G x 1½, 0.50x40 mm) for reconstitution and administration.

14.3.2 Placebo Packaging

Placebo will be provided in a kit containing one single-use 2R Placebo vial and one prefilled syringe with 0.5 mL sterile water for injection and a sterile needle set (i.e. 2x 25G x 1½, 0.50x40 mm) for preparation and administration.

The Placebo preparation will mimic as far as technically possible the preparation of the VLA1553, due to clinical study blinding reasons. Hence for Placebo administration the 1.5 mL pre-filled syringe in the Placebo kit will be used.

The solvent is sterile water for injection and supplied in a 1.5 mL pre-filled syringe, filled with 0.5 mL and closed with a temper-evident closure system (Vetter V-OVS®) to safeguard the product integrity.

14.4 IMP Labeling

The IMP will be labeled according to the valid regulatory requirements for clinical trials. The expiry date of VLA1553 and Placebo differ on the outer kit box and vials, respectively.

14.5 IMP Storage

14.5.1 VLA1553 Storage

The drug product has an expected retest date of 24 months from the date of manufacture, considering the specified storage conditions of +2-8°C. A stability program is currently ongoing and if any impact on the stability profile are observed, the study sites will be informed accordingly. The vaccine must not be used after the retest date indicated on the package.

The IMP must be stored at +2-8°C in a refrigerator in a room not accessible to unauthorized persons. Storage at room temperature or higher should be avoided because of potential impairment to immunogenicity and tolerability. Temperature monitoring systems will be used.

14.5.2 Placebo Storage

The Placebo has an expected retest date of 36 months from the date of manufacture, considering the specified storage conditions of +2-8°C (35.6 °F to +46.4 °F). A confirmatory stability program is currently ongoing and if any impact on the stability profile are observed, the study sites will be informed accordingly. The Placebo must not be used after the retest date indicated on the package.

The Placebo must be stored at +2-8°C (35.6 °F to +46.4 °F) in a refrigerator in a room not accessible to unauthorized persons. Storage at room temperature or higher should be avoided. Temperature monitoring systems will be used.

14.5.3 Dispensing and Accountability of IMP

Current drug accountability logs have to be maintained, detailing the dates and quantities of IMP administered to each subject. Records will be maintained that include subject identification code (SIC), dispensation date, and amount dispensed. This documentation will be available to the designated unblinded CRA to verify drug accountability during the study and to perform overall drug accountability.

Used and unused IMP will be accounted for and returned to the CMO/ Sponsor. In addition, used IMP can be destroyed on-site upon Sponsor approval.

A study specific IMP manual with further details on IMP handling will be provided.

15. STUDY PROCEDURES

15.1 Informed Consent and Enrollment

Subjects are considered enrolled in the study by providing written or electronic informed consent by the subject's legally authorized representative(s) (i.e., signs and dates the informed consent form), and informed assent of the subject, if applicable. The electronic consent/assent process must follow the recommendations of the CONEP circular letter No. 23/2022, regarding the use of electronic consent and assent for research and biobank participants.

The Investigator will inform the subject/ subject's legal representative(s) about the procedures, risks and benefits of the study. Fully informed, written or electronic consent must be obtained from subject's legal representative(s) prior to any assessment being performed. In addition, written or electronic informed assent of the competent adolescent will be obtained, provided the intellectual and emotional ability to comprehend the procedures, risks and benefits of participation in the study are given. It is important that the subject/ legal representative(s) are allowed sufficient time to decide on the participation in the study.

15.2 Subject Identification Code

The following format of Subject Identification Code is agreed within the VLA1553 study program by Valneva: At Visit 0, a 13-character subject identification code shall be assigned to each subject. The first four digits are the product identifier (e.g. 1553 for this product) provided by Valneva. The fifth digit is the study identifier (i.e. 1553-3 for this Phase 3 study), the sixth and seventh digits are site identification number (i.e. 1553-3-01). The last three digits are assigned in ascending order as the subjects are enrolled (i.e., signing the informed consent and assent form, e.g. 1553-3-01-001).

Due to organizational reasons, for VLA1553-321 study, Butantan's pre-assigned site code (three capital letters plus two digits) will be used (instead of two digits according to Valneva format) for primary documentation including also IXRS and EDC. For statistical analysis, a separate output including Valneva's site code format of two digits only will be prepared to be in line with overall VLA1553 program.

15.3 Investigational Treatment

15.3.1 Description of Treatment

All subjects will receive a single intramuscular vaccination in the deltoid region of the arm of VLA1553 or control according to the vaccination schedule as described in 24.1 of Study Procedures. Subjects will be assigned in a 2:1 ratio to one of the two Study Arms and will receive either the final adult dose of VLA1553 or control. Subjects will be followed up for

approximately 6 months (all subjects) or 12 months (immunogenicity subset) following the vaccination (see also Section 12.1).

15.3.2 Vaccine Preparation and Administration

VLA1553 is available as a suspension after reconstitution of targeted 1×10^4 TCID₅₀ per 0.5 mL dose.

IMP preparation (to be done in a separate room by unblinded study staff, unobserved by the subject and blinded study staff) and administration (by unblinded or blinded study staff) will be done according to the following procedure:

1. CAUTION: Preservatives, antiseptics, detergents, and other anti-viral substances may inactivate the vaccine. Use only provided sterile syringes that are free of preservatives, antiseptics, detergents, and other anti-viral substances for reconstitution and injection of VLA1553.
2. Before reconstitution, the lyophilized VLA1553 is a white to pale yellow compact crystalline plug. VLA1553 when reconstituted, is a clear pale to slightly yellow liquid solution.
3. The solvent is sterile water for injection and supplied in a 1.5 mL pre-filled syringe, filled with 0.5 mL and closed with a temper evident closure system (Vetter V-OVS®) to safeguard the product integrity.
4. VLA1553 must be reconstituted by adding the entire content of the pre-filled syringe of the solvent into the vial containing the lyophilized powder.
5. Twist the white temper evident closure system on the syringe bottom and remove the part of the closure system. For reconstitution, immediately attach the first provided needle on the Luer lock of the syringe by twisting the needle clockwise until it locks.
6. Puncture the stopper of the vial with the needle on the syringe and add the entire amount of the solvent of the syringe into the vial containing the powder cake. Gently agitate the vial to dissolve completely and wait for at least one minute for complete reconstitution of the vaccine. Avoid strong shaking or vortexing. Inspect the liquid solution by visual control for any particulate matter and discoloration prior to administration.
7. Withdraw the entire amount from the vial of the reconstituted vaccine into the same syringe with the same attached needle.
8. To administer the vaccine, the second provided needle must be used. Change the needle and inject the reconstituted vaccine intramuscularly (i.m.) into the deltoid muscle as soon as possible within an allowable time window of maximal 2 hours. In case the

second provided needle is in the investigator's opinion not appropriate, a 1-inch needle can be used instead.

9. The used vials should be kept within the empty kits for drug accountability purposes. Empty syringes and used needles should be disposed in accordance with local requirements.
10. For further information please refer to the IMP Manual provided in the Investigator File.

Under no circumstances should the VLA1553 vaccine be administered intravascularly, as this could lead to hypersensitivity reactions such as shock.

Anaphylaxis or other possible severe acute, post-vaccination adverse reactions to vaccines, including VLA1553 vaccine, are very rare, but can occur. Therefore, appropriate emergency equipment and medication as well as adequately trained personnel must be on site whenever a vaccination is performed.

A study specific IMP manual with further details on IMP handling will be provided.

15.3.3 Placebo Preparation and Administration

The Placebo preparation will mimic as far as technically possible the preparation of the VLA1553, due to clinical study blinding reasons. Hence for Placebo administration, the 1.5 mL pre-filled syringe in the Placebo kit will be used, after discarding its content.

The pre-filled syringe contains sterile water for injection, filled with 0.5 mL and closed with a temper evident closure system (Vetter V-OVS®) to safeguard the product integrity.

Twist the white temper evident closure system on the syringe bottom and remove the part of the closure system. Immediately attach the reconstitution needle on the luer lock of the syringe by twisting the needle clockwise until it locks. **Empty the pre-filled syringe** (into normal waste/sewer) by pressing slowly the plunger rod, until all sterile water inside the syringe is removed.

Remove the flip off seal from the vial and puncture the stopper of the Placebo vial with the needle and withdraw the entire volume of the Placebo vial into the syringe. Inspect the liquid solution by visual control for any particulate matter and discoloration prior to administration.

To administer the Placebo, a new provided needle must be used. Change the needle and inject the Placebo intramuscularly (i.m.) into the deltoid muscle as soon as possible within an allowable time window of maximal 2 hours.

The used vials should be kept within the empty kits for drug accountability purposes. Empty syringes and used needles should be disposed in accordance with local requirements.

A study specific IMP manual with further details on IMP handling will be provided.

15.3.4 Post- Vaccination Observation

Following vaccination, the subject will be observed for at least 60 minutes at the study site in order to provide appropriate emergency treatment should this be necessary. In addition, vital signs including pulse rate and blood pressure while seated and at rest will be measured prior to discharge (for further information see Section 17.7). Any injection site and systemic reactions will be recorded.

Prior to leaving the study site, the subject will be given the respective Subject Diary for documentation of AEs (for further information see Section 17.3), a digital thermometer for measuring axillary body temperature and a measuring device for assessing injection site reactions (at the vaccination visit only).

15.4 Screening and Study Visits

The overall study design is illustrated in Figure 24.1-1 (in Section 24.1). For a tabular outline of study procedures and assessments required at each visit, please see Table 15.4-1, Table 15.4-2 and Table 15.4-3 as well as the Schedule of Study Procedures and Assessments in Section 24.2 and 24.3.

15.4.4 CHIKV Infection Visits (Acute Visit and Convalescent Visit)

Should a subject develop fever after vaccination he/she/ legal representative(s) will be instructed to report any fevers to the Investigator and visit the site for an acute visit within seven days of illness onset (whenever possible at a pre-defined study visit). During this acute visit a blood sample will be collected for a retrospective quantitative CHIKV RT-qPCR and CHIK μ PRNT. In addition, samples will be collected for CHIK, Zika and Dengue RT-PCR and CHIK, Zika and Dengue antibody detection by ELISA (IgG and IgM) for acute diagnostics at the local laboratory for treatment according to standard of care.

At three weeks after the acute visit, subjects will be asked to come to the site for a convalescent visit where a convalescent blood sample will be taken for assessment for potential retrospective analysis in CHIKV RT-qPCR and CHIK μ PRNT in paired acute/convalescent samples. In addition, serum samples will be collected for potential CHIK, Zika and Dengue antibody detection by ELISA (IgG only) for analysis at the local laboratory for treatment according to standard of care.

In addition, Investigators are advised to perform a clinical work-up as described in Section 17.12.1 if subjects present with any clinical signs or symptoms characteristic or suggestive of an acute natural CHIKV infection or disease and to treat them according to current medical standard and care until resolved or stabilized.

All CHIKV infections and clinical manifestations of CHIKV will be discussed and assessed by an independent Data Safety Monitoring Board. Retrospective investigation of a pre-vaccination sample may be considered for clinical work-up. A definite CHIKV infection must be evidenced by viremia analyzed by RT-qPCR and clinical diagnosis. In case of detection of other viruses (e.g. DEN, ZIKV or SARS-CoV-2), subjects will be treated according to standard of care. Clinical manifestations suggestive of CHIKV without detectable viremia have to be confirmed by seroconversion using CHIKV μ PRNT.

A detailed description on how to classify CHIKV cases is described in Section 17.12.1.

A proposed study visit schedule for a Chikungunya Infection Visit is described in Table 15.4-4 below:

Table 15.4-4		
Study VLA1553-321 Study Visit Schedule – Chikungunya Infection Visit		
VISIT	TIME	ACTION

15.4.5 Unscheduled Visit

An unscheduled visit can be held at any time during the study if deemed necessary by the Investigator (e.g. follow-up on unexpected AEs or SAEs) or the DSMB. Assessments performed at an unscheduled visit will be at the Investigator's or DSMB's discretion. Unscheduled visits and any procedures/assessments performed during such a visit (e.g. physical examination, laboratory test) should be documented in the source data and the eCRF.

15.4.6 Early Termination Visit

Subjects who terminate participation or who are withdrawn from the study prematurely will undergo investigations as outlined below during an Early Termination Visit, if possible. Every effort should be made to have discontinued subjects complete the study Early Termination (ET) Visit (see Table 15.4-5).

Table 15.4-5 Study VLA1553-101 Study Visit Schedule – Early Termination		
VISIT	TIME	ACTION
ET	unscheduled	<ol style="list-style-type: none"> 1. Review/Collect Subject Diary or Memory Aid, as applicable (Section 17.3) 2. Review/Collect Pregnancy Diary, if applicable (Section 17.5) 3. AE/AESI/SAE documentation (Section 17.2) 4. Concomitant medication (Section 17.6.2) 5. Symptom-driven physical examination, Hand Stiffness Test and Vital Signs (Section 17.7 and 17.8) 6. <u>Blood draw and urine sample for:</u> <ol style="list-style-type: none"> a) Urine Pregnancy test ^a b) Immunogenicity ^b c) Viremia ^c 7. Documentation of reason(s) for early termination
^a A urine pregnancy test will be performed for all female subjects of childbearing potential. ^b Immunogenicity sample for CHIKV-specific neutralizing antibody titer evaluation, development of further assays or retrospective safety analysis. For further information on the preparation, storage and shipment of blood samples please refer to the instructions in the respective Laboratory Manual provided in the Investigator File. ^c Only if the ET visit occurs prior to Day 29, a viremia plasma sample should be obtained from ALL subjects for clinically indicated retrospective investigation of viremia by RT-qPCR.		

In case an ET Visit is not possible, a follow-up safety phone call should be made as soon as possible after termination to capture at least concomitant medications and solicited and unsolicited AEs since the last study visit.

The reason for early termination should be clarified in as much detail as possible. If an AE was the reason for early study termination details on that specific AE(s) should be captured (see Section 13.5). The reason for discontinuation will be recorded on the eCRF, and data collected up to the time of discontinuation will be used in the analysis and included in the clinical study report.

In the event of subject discontinuation due to an AE, clinical and/or laboratory investigations that are beyond the scope of the required study observations/assessments may be performed as part of the evaluation of the event. These investigations will take place under the direction of the Investigator in consultation with the Sponsor, and the details of the outcome may be reported to the appropriate regulatory authorities by the Sponsor.

15.5 Procedures for Monitoring Subject Compliance

All study procedures are to be performed under the supervision of the Investigator at the study site, and thus, no separate procedures will be used to monitor subject compliance.

16. ASSESSMENT OF IMMUNOGENICITY

All serum samples for neutralization titer determination will be handled according to the procedures supplied to each investigative site for the preparation, storage and shipment of samples (refer to Laboratory Manual). Each clinical study site will be responsible for the separation of serum from whole blood samples and the safe and controlled storage of serum samples prior to shipment to the central laboratory.

At the end of the study, results of immunogenicity assessments will be provided to the Investigator.

Immunogenicity samples (using μ PRNT) will be collected from ALL subjects at the indicated time points and may be used for additional testing procedures (see Section 16.2). However, immunogenicity assessment measuring neutralizing antibodies will be performed on samples collected at Day 1, 8, 29, 85, Month 6 and Month 12 after a single immunization. Day 1 samples will be analyzed for all subjects, whereas the other samples collected, i.e. Day 8, 29, 85, Month 6 and Month 12, will be analyzed for the immunogenicity subset only.

16.1 Determination of vaccine-induced neutralizing antibody response

Immunogenicity of VLA1553 will be evaluated using a micro Plaque Reduction Neutralization Test (μ PRNT), which is based on the same principle as a plaque reduction neutralization assay (PRNT), but allows testing with higher throughput. This assay differs from the μ NT assay used for the assessment of neutralizing antibodies during Phase 1 clinical testing. Chikungunya virus neutralizing antibodies will be measured in the μ PRNT using a serially passaged, live-attenuated CHIKV vaccine (CHIKV 181/25, TSI-GSD-218 or 181/clone 25) developed by the Walter Reed Army Institute of Research (WRAIR, US).

The CHIKV μ PRNT evaluates the levels of antibodies that neutralize CHIKV infection of Vero cells in human serum samples.

Seven (7) two-fold serial dilutions of the de-complemented serum samples are prepared in round-bottom 96-well plates. CHIKV 181/25 at a target working dilution (to obtain 100 PFU/well) is added sequentially to the serum dilutions and incubated at 37°C and 5% CO₂ for 60 minutes. Serum-virus complexes are then transferred onto plates, previously seeded overnight with Vero cells, and incubated at 37°C and 5% CO₂ for 60 minutes. Then, the serum-virus complexes are removed and a virus maintenance medium containing 0.5% Methyl Cellulose is added to the wells, followed by an incubation of 17 ± 1 hours at 37°C and 5% CO₂. The following day, cells are fixed with 4% Paraformaldehyde for 15 minutes and permeabilized with 0.2% Triton X-100. Following cell permeabilization, indirect immunostaining is performed. Primary antibody diluted in blocking agent is added to the plates and incubated at 37°C for 60 minutes. Afterwards, the secondary antibody diluted in blocking agent is added to the plates

and incubated at 37°C for 30 minutes. Substrate is added to the plates and incubated for 10 minutes in the dark. Plates are rinsed with sterile water and left to be dried completely. Images from each well are acquired by an automated microscope system (ScanLab reader). The number of resulting PFU in the wells is inversely proportional to the level of functional antibodies present in the serum, which is directly proportional to the immunological response of the subject.

The cut-off of CHIKV-specific neutralization antibody titer to be used in the analysis of seroconversion was defined during μ PRNT assay validation as a >4-fold increase of μ PRNT₅₀ compared to baseline (Day 1).

16.2 Additional Testing Procedures

Serum samples obtained in this study may, in addition to its use for assessment of CHIKV-specific neutralizing antibody titers, also be used for further development of the vaccine, including but not limited to the following assays:

- Passive immunization assays to evaluate the potency of immune sera to protect animals from infection after wt challenge;
- Development of additional neutralization assays (e.g. μ NT, PRNT, virus replicon particle neutralization assays) for the assessment of cross-neutralization of heterologous CHIKV strains or other related (alpha)viruses;
- Detection of anti-CHIKV antibodies by enzyme linked immunosorbent assay (ELISA);
- Detection of viremia by viral culture;
- CHIKV sequencing;
- Clinical diagnostic work-up.

Such development may occur at laboratories other than the central or local analytical laboratory used for this study.

17. ASSESSMENT OF SAFETY

17.1 Definitions

17.1.1 Adverse Events

An adverse event (AE) is defined as any untoward medical occurrence in a subject administered an investigational product that does not necessarily have a causal relationship with the treatment. All new abnormalities or any exacerbation in intensity or frequency (worsening) of a pre-existing condition during or after vaccination have to be documented as AEs.

17.1.2 Serious Adverse Event

A **serious** adverse event (SAE) is defined as any untoward medical occurrence that at any dose meets one or more of the following criteria:

- Outcome is fatal/results in death (including fetal death);
- Is life-threatening – defined as an event in which the subject was, in the judgment of the Investigator, at risk of death at the time of the event; it does not refer to an event that hypothetically might have caused death had it been more severe;
- Requires inpatient hospitalization or results in prolongation of an existing hospitalization;
- Results in persistent or significant disability/incapacity (i.e., a substantial disruption of a person's ability to conduct normal life functions);
- Results in congenital anomaly/birth defect;
- Is a medically important condition – a medical event that may not be immediately life-threatening or result in death or require hospitalization but may jeopardize the subject or may require medical or surgical intervention to prevent one of the other outcomes listed in the definitions above. This definition also applies to progression of disease leading to a serious outcome.

Hospitalization or prolonged hospitalization for diagnostic or elective medical procedures (including plastic surgeries) that were planned prior to vaccination are not reported as an SAE. The treatment of a pre-existing condition that did not change in severity, the condition leading to hospitalization or prolonged hospitalization and also the medical procedure itself are not reported as an SAE. In this case, the underlying diagnosis or condition should be reported in the medical history section of the eCRF and the corresponding medical procedure should be documented as a comment to the underlying diagnosis or condition in the eCRF's medical history section.

The Investigator will classify the SAEs as either expected or unexpected:

- **Expected:** An AE that is listed in the current Investigator's Brochure (IB);
- **Unexpected:** An AE that is not listed in the current IB, or it differs because of greater severity or greater specificity.

For the purpose of this study, AEs graded as potentially life-threatening (Grade 4) (see Section 17.2.3 for solicited AEs) will be reported as SAEs.

17.1.3 Adverse Events of Special Interest

An AESI (serious or non-serious, see Section 17.11) is an event of scientific and medical concern specific to the Sponsor's product.

17.1.4 Medically-Attended Adverse Event

All AEs where subjects are seeking medical care (i.e. doctor's office, emergency service, hospital, but not including use of self-medication).

17.1.5 Preexisting Diseases

Preexisting diseases that are present before entry in to the study, that are described in the medical history, and that manifest with the same severity, frequency, or duration after vaccine exposure, will not be recorded as AEs. Furthermore, routine health checks required due to pre-existing diseases will not be recorded. However, when there is an increase in the severity of a preexisting disease, the event must be described on the AE CRF page.

17.1.6 Untoward Medical Occurrences Not Considered Adverse Events

Each untoward medical occurrence experienced before vaccine exposure (for example, from the time of signed informed consent up to but not including vaccine exposure) will be described in the medical history.

17.2 Collection, Documentation and Assessment of Adverse Events

17.2.1 Unsolicited Adverse Events

Subjects/ legal representative(s) will be provided with a Memory Aid to collect unsolicited AEs occurring until Day 180 (Visit 5, see Section 17.3). Additionally, the Investigator will enquire about AEs during study visits. Clinically relevant laboratory parameter changes constitute unsolicited AEs, too, unless they are considered a symptom of an underlying AE or part of a

syndrome that is reported as AE (e.g. presence of blood cells in urine in a person diagnosed with urinary tract infection). In addition, symptoms noted during the symptom-driven physical exams (unless already covered by an AE) constitute AEs.

All unsolicited AEs need to be documented in the respective AE section of the eCRF during applicable study visit (Visits 1 to 5, CHIKV infection visits, or unscheduled visit(s), if applicable), regardless of their source (AEs noted in the Memory Aid (see Section 17.3), open question to subject, laboratory parameters, symptom-driven physical examination). SAEs will continue to be documented until the end of the study.

Any symptom is regarded as a separate AE. However, if the Investigator considers several symptoms to be in the context of one underlying diagnosis, the Investigator may merge these symptoms into one single appropriate AE. The AE term entered into the eCRF should contain all symptoms summarized to one event (e.g. "Influenza with flu-like-symptoms, fever and headache").

The Investigator will follow-up on each AE until it is resolved or until the medical condition of the subject is stable. All relevant follow-up information will be reported to the Sponsor until the end of the study for each subject. SAEs ongoing at the time of Visit 6 will be followed until resolution or achievement of stable clinical conditions, latest until the overall end of the study.

Beyond study end, SAEs that are fatal, life-threatening or suspected to be related to study treatment will continue to be reported until 6 months after the last study visit of the respective subject (i.e. Visit 5 or Visit 6, respectively).

The following information will be documented for each AE: severity, causality, outcome, seriousness, medically-attended, action taken to treat AE, start and stop dates.

17.2.1.1 Severity

The investigator will assess the severity of AEs using his/her clinical expertise and judgment based on the most appropriate description below:

- | | |
|----------------------------|--|
| Mild (Grade 1): | Awareness of signs or symptoms, but easily tolerated, does not interfere with daily activities. |
| Moderate (Grade 2): | Discomfort enough to interfere with usual activity and with or without requiring medical intervention. |
| Severe (Grade 3): | Incapable of work or usual activity and requiring medical intervention. |

17.2.1.2 Causality

Causality is a determination of whether there is a reasonable possibility that the vaccine administration is etiologically related to/associated with the AE.

For AEs, the Investigator will assess the causal relationship between the IMP and the AE using his/her clinical expertise and judgement according to the following most appropriate algorithm for the circumstances of the AE:

Probable: Reaction that follows a reasonable temporal sequence from administration of the IMP, or that follows a known or expected response pattern to the suspected treatment; and that could not reasonably be explained by known characteristics of the subject's clinical state.

Possible: Reaction that follows a reasonable temporal sequence from administration of the IMP, or that follows a known or expected response pattern to the suspected treatment; but that could readily have been produced by a number of other factors.

Unlikely: Reports not following a reasonable temporal sequence from administration of the IMP; an event, which may have been produced by the subject's clinical state or by other environmental factors. A more likely alternative etiology exists.

Not related (unrelated): Events for which sufficient information exists to conclude that the etiology is unrelated to the IMP.

AEs with a causality reported as probable or possible will be considered related to the IMP. AEs with missing causality assessment will be regarded as related unless further specified. All other AEs will be considered as not related to IMP.

17.2.2 Assessment and Outcome of Adverse Events

Each AE from vaccination until study completion/termination will be described in the eCRF (i.e., 1 AE per form) using the medical diagnosis (preferred), symptom, or sign, in standard medical terminology in order to avoid the use of vague, ambiguous, or colloquial expressions (see definition in Section 17.1.1). AEs will be evaluated by the Investigator for:

- Seriousness as defined in Section 17.1.2
- Severity as defined in Section 17.2.1.1
- Causal relationship to vaccine exposure as defined in Section 17.2.1.2

For each AE, the outcome will also be documented as either:

- recovering/resolving
- recovered/resolved
- recovered/resolved with sequelae
- not recovered/not resolved
- fatal
- unknown

If the severity rating for an ongoing AE changes before the event resolves, the AE will not be reported a second time. Instead the original AE report will be revised. For purposes of data capture the highest severity rating during the course of a single AE will be the severity rating entered on the AE CRF.

NOTE: A subject's death per se is not an event, but an outcome. The event which resulted in the subject's death must be fully documented and reported, regardless of being considered related to treatment or not.

17.2.3 Solicited Adverse Events

17.2.3.1 Injection Site Reaction – Measurement and Evaluation

Subjects will be provided with a measuring device to measure the size of any measurable injection site reaction that may develop after vaccination. The subject/ legal representative(s) will be instructed on how to measure any such reactions over a period of ten consecutive days after vaccination along the longest diameter of the reaction area and record this measurement in the subject diary (see Section 17.3). Injection site reactions include injection site pain, tenderness, erythema/redness, induration/swelling (see Table 17.2.1).

Injection site reactions will be rated based on the FDA Guidance on Toxicity Grading Scales as described in Table 17.2-1. Any grade 4 injection site reaction should be reported as an SAE (see Section 17.1.2). All injection site reactions will be considered as related to IMP.

Table 17.2-1				
Grading of Injection Site Reactions – Vaccine Specific Criteria				
Vaccine-specific Criteria	Mild (Grade 1)	Moderate (Grade 2)	Severe (Grade 3)	Potentially Life Threatening (Grade 4) ^c
Pain	Does not interfere with activity	Repeated use of non-narcotic pain reliever > 24 hours or interferes with activity	Any use of narcotic pain reliever or prevents daily activity	Emergency room (ER) visit or hospitalization
Tenderness	Mild discomfort to touch	Discomfort with movement	Significant discomfort at rest	ER visit or hospitalization
Erythema Redness ^a	/ 2.5 – 5.0 cm 0.98 – 1.96 inch	5.1 – 10.0 cm 1.97 – 3.94 inch	> 10.0 cm > 3.94 inch	Necrosis or exfoliative dermatitis
Induration Swelling ^b	/ 2.5 – 5.0 cm (0.98–1.96 inch)	5.1– 10.0 cm	> 10.0 cm	Necrosis

	and does not interfere with activity	(1.97 – 3.94 inch) or interferes with activity	(> 3.94 inch) or prevents daily activity
^a	In addition to grading the measured local reactions at the greatest single diameter.		
^b	Induration / swelling should be evaluated and graded using the functional scale as well as the actual measurement.		
^c	Any Grade 4 injection site reaction will be reported as SAE. Grade 3 severity should be documented.		

17.2.3.2 Systemic Reactions – Measurement and Evaluation

Systemic reactions include fever, nausea/vomiting, headache, fatigue, myalgia (muscle pain), arthralgia (joint pain) and rash will be reported in a standardized manner over a period of ten consecutive days after vaccination.

Systemic reactions will be rated based on the FDA Guidance on Toxicity Grading Scales as described in Table 17.2-2. Any grade 4 systemic reaction should be reported as an SAE (see Section 17.1.2).

Table 17.2-2
Grading of Systemic Reactions – Vaccine Specific Criteria

Vaccine-specific Criteria	Mild (Grade 1)	Moderate (Grade 2)	Severe (Grade 3)	Potentially Life Threatening (Grade 4) ^c
Fever	37.8 – 38.4 °C	38.5 – 38.9 °C	39.0 – 40.0 °C	> 40.0 °C
Nausea/vomiting	No interference with activity or 1 – 2 episodes/24 hours	Some interference with activity or > 2 episodes/24 hours	Prevents daily activity, requires outpatient IV hydration	ER visit or hospitalization for hypotensive shock
Headache	No interference with activity	Repeated use of non-narcotic pain reliever > 24 hours or some interference with activity	Significant; any use of narcotic pain reliever or prevents daily activity	ER visit or hospitalization
Fatigue	No interference with activity	Some interference with activity	Significant; prevents daily activity	ER visit or hospitalization
Myalgia	No interference with activity	Some interference with activity	Significant; prevents daily activity	ER visit or hospitalization
Arthralgia ^a	No interference with activity	Some interference with activity	Significant; prevents daily activity	ER visit or hospitalization
Rash ^b	Macules/papules covering <10% body surface area (BSA) with or without symptoms (e.g., pruritus, burning, tightness)	Macules/papules covering 10- 30% BSA with or without symptom (e.g., pruritus, burning, tightness); limiting instrumental activity of daily living	Macules/papules covering >30% BSA with or without associated symptoms; limiting self-care activity of daily living	-

^a Symptom not described in FDA Toxicity Grading Scale.

^b Grading based on Common Terminology Criteria for Adverse Events (CTCAE), NIH, v4.03, 2010.

^c Any Grade 4 systemic reaction will be reported as SAE, Grade 3 severity should be documented.

17.2.3.3 Body Temperature Measurement

From vaccination (Day 1) until Day 11 after vaccination (i.e., the first 10 post-vaccination days including the day of vaccination), the subject/legal representative(s) should measure the body temperature axillary once every evening, assessments by the subject should occur at the same time each day, starting approximately 8 hours after vaccination (see also 15.4.4). To optimize the comparability of the documented body temperatures, all subjects/ legal representative(s) will be provided with a digital thermometer and be instructed in its use. The subjects/ legal representative(s) may keep the thermometer after study termination.

If fever (axillary body temperature $\geq 37.8^{\circ}\text{C}$) occurs, body temperature should be measured at least every 4 to 8 hours until it returns to normal ($< 37.8^{\circ}\text{C}$). All body temperature measurements including the date and time should be recorded in the subject diary (see Section 17.3). In case of fever, the subject/ legal representative(s) should record all fever measurements in the subject diary including the first value that shows a return to normal body temperature.

Body temperature measurements from vaccination (Day 1) until Day 11 after vaccination (i.e., the first 10 post-vaccination days including the day of vaccination) will be recorded by the Investigator in the eCRF. If more than one body temperature value is recorded in the subject diary for a given day, the highest daily temperature reading will be recorded in the eCRF.

Body temperature measurements will be analyzed according to the FDA Guidance on Toxicity Grading Scales for Healthy Adult and Adolescent Volunteers Enrolled in Preventive Vaccine Clinical Trials (Food and Drug Administration) for data analysis as described in Table 17.2-2 above.

Outside of the first 10 post-vaccination days, daily body temperature measurement is **not required**. However, subjects experiencing an AE with symptoms of fever are recommended to measure their body temperature in order to document fever as an AE in the Memory Aid. If fever (i.e., axillary body temperature $\geq 37.8^{\circ}\text{C}$) occurs, it is recommended that the subject/ legal representative(s) measures his/her body temperature every 4 to 8 hours until fever resolves (i.e., axillary body temperature $< 37.8^{\circ}\text{C}$) in order to document onset and resolution, as defined by the date of first axillary body temperature measurement of $\geq 37.8^{\circ}\text{C}$ (date of onset) and the date of first axillary body temperature measurement of $< 37.8^{\circ}\text{C}$ (date of resolution).

17.3 Safety Questionnaires

Subjects/ legal representative(s) will be provided with two types of safety questionnaires throughout the course of this study:

- **Subject Diary** will be distributed to all subjects/ legal representative(s) for the collection of safety information from the day of vaccination until the first 10 post-vaccination days (i.e. including the day of vaccination)
- **Memory Aid** will be distributed to all subjects/ legal representative(s) for the collection of safety information outside the first 10 post-vaccination days until the next visit.

In addition, all subjects/ legal representative(s) will be provided with a Safety Card at Day 1 (Visit 1), informing the subjects/ legal representative(s) in lay language to contact the study site in case of SAEs.

The following information will be collected in the Subject Diary (10 days post-vaccination):

- Measurement of axillary body temperature (For further information see Section 17.2.3.3);
- Solicited injection site reactions^{xv}(injection site pain, tenderness, erythema/redness, induration/swelling), for further information see Section 17.2.3.1;
- Solicited systemic reactions^{xiii} (fever, fatigue, headache, nausea/vomiting, muscle pain, joint pain, rash), for further information see Section 17.2.3.2;
- Other AEs;
- Any new concomitant medication or changes in medication taken after vaccination;

The following information will be collected in the Memory Aid (outside 10 day post-vaccination period):

- AEs;
- Any new concomitant medication or changes in medication taken after vaccination;
- Ongoing solicited reactions;

Assessments for the Subject Diary should start on the day of vaccination and occur at the same time each day, starting approximately 8 hours after vaccination for a total of 10 consecutive days. The subject/ legal representative(s) will be properly instructed on the reporting requirements and how to complete and use the diary, thermometer and measuring device (for assessment of measurable injection site reactions).

For adolescents capable of reading and writing and capable of understanding the diary process, the subject may complete the diary himself/herself. For subjects unable to read, write or to understand the diary process, the legal representative(s) should fill out the safety questionnaires.

^{xv} Solicited injection site and systemic reactions in Subject Diary will be assessed by the subject for absence, presence and duration

Safety questionnaires are always to be returned at the next visit and will be assessed by the Investigator together with the subject/ legal representative(s), prior to these data being entered into the electronic case report form (eCRF). The Investigator will review and discuss the safety questionnaires with the subject/ legal representative(s), ask about AEs occurring since the last visit and the subject's legal representative(s)/ subject and Investigator have to sign the safety questionnaires to ensure completeness and reliability of (self-)reporting. The safety questionnaires are to be collected by the Investigator at indicated visits and new ones will be distributed. The entries in the respective safety questionnaires shall be evaluated and solicited/ unsolicited AEs graded for severity and relatedness to the vaccination by the Investigator.

The safety questionnaires will serve as source documentation. Entries in the safety questionnaires will be transcribed onto the appropriate eCRFs. Any entry on the eCRF that does not correspond with an entry in the safety questionnaires will be explained by the Investigator on the relevant safety questionnaire page.

17.4 Safety Card

Subjects will be provided with a Safety Card at Visit 1 (Day 1), informing and instructing the subjects/ legal representative(s) in lay language to contact the study site in case of SAEs.

17.5 Pregnancy Diary

Female subjects will be provided with a Pregnancy Diary. Female subjects of reproductive potential (after onset of menarche) must capture the results of the **urine** pregnancy test additionally.

Female subjects of childbearing potential are requested to perform a urine pregnancy test at home on a monthly basis between Visit 4 (Month 3) and Visit 5 (Month 6). In addition, a monthly urine pregnancy test is required for subjects of the immunogenicity subset between Visit 5 (Month 6) and Visit 6 (Month 12). The subject/ legal representative(s) will be properly instructed on the use of the monthly **urine** pregnancy test and the documentation requirements on the results in the Pregnancy Diary.

Pregnancy Diaries are always to be returned at the next visit and will be assessed by the Investigator together with the subject/ legal representative(s), prior to these data being entered into the eCRF. The subject's legal representative(s)/ subject and Investigator have to sign the Diary to ensure completeness and reliability. The diary has to be collected by the Investigator at indicated visits and a new one will be distributed.

If a subject presents with a positive pregnancy test during the study, she and her legal representative(s) should be requested to immediately inform the Investigator. The subject is asked to attend all remaining visits according to schedule.

The Pregnancy Diary will serve as source documentation. Entries in the Pregnancy Diary will be transcribed onto the appropriate eCRFs. Any entry on the eCRF that does not correspond with an entry in the Pregnancy Diary will be explained by the Investigator on the relevant Pregnancy Diary page.

17.6 Medical, Medication, and Non-Drug Therapy History

17.6.1 Medical history

At screening, the subject's medical history will be described or surgery and start and end dates, if known: eyes, ears, nose, and throat; respiratory; cardiovascular; gastrointestinal; musculoskeletal; neurological; endocrine; metabolic; hematopoietic/lymphatic; dermatological; and genitourinary.

In addition, the medical history covering the last 3 years prior to screening will include the following:

- Information on prior vaccination against relevant traveler vaccines (i.e. yellow fever, Japanese encephalitis virus vaccine)
- Previous chikungunya virus infection;
- Other vector-borne diseases in the past;
- Previous trauma to joints;
- Information on planned hospitalizations (including elective surgery) during the study for medical conditions existing prior to or at study entry. Such planned hospitalizations will not need to be reported as SAEs.

17.6.2 Concomitant Medications and Non-Drug Therapies

All medications received from 2 weeks prior to study enrollment until completion/termination should be collected from all subjects/ legal representative(s), and recorded on the appropriate eCRF. In addition to product name (generic name), the dose, indication, route of administration and frequency as well as the start and end date of treatment will be documented.

In addition, medications to treat SAEs will be reported to the Sponsor on SAE Report Forms as described in Section 4. In context of this study, information on non-drug therapies will only be collected in relation to SAEs.

The following medications are **not permitted** if administered within the specified study periods (unless such treatment has to be administered in an emergency situation):

- Any blood products or immunoglobulins during the course of the study;

- Immunosuppressive therapies (e.g. systemic or high dose inhaled [>800 µg/day of beclomethasone dipropionate or equivalent], corticosteroids, radiation treatment or other immunosuppressive or cytotoxic drugs) during the course of the study;
- Prophylactic administration of antipyretics within 4 hours prior to and during the first 72 hours after vaccination;

For documentary purposes, any of the treatments listed above (including emergency treatment) given within these time periods requires special documentation and is to be documented as a protocol deviation.

The following medications and procedures will **delay** vaccination:

- antipyretics received within 4 hours prior to vaccination.
- any live or inactivated vaccine received within 28 days or 14 days prior to vaccination, respectively.

Usage of any other medications or non-drug therapies is not restricted.

Additionally, medications that are not permitted prior to study enrollment, resulting in exclusion from the study, are reflected in the exclusion criteria in Section 13.2.

17.7 Vital Signs

Vital signs will include body temperature (°C) measured axillary, pulse rate (beats/min), and systolic and diastolic blood pressure (mmHg) while seated and at rest.

Vital signs will be measured at screening (Visit 0) and at the vaccination visit (Visit 1) and are to be recorded before the vaccination is given. In addition, after an observation period of 60 minutes at the study site following vaccination pulse rate as well as blood pressure while seated and at rest will again be assessed.

Vital sign values are to be recorded on the appropriate eCRF. For each vital sign value, the Investigator will determine whether the value is considered an AE (see definition in Section 17.1.1). If assessed as an AE, the medical diagnosis (preferably), symptom, or sign, will be recorded on the AE CRF. Additional tests and other evaluations required to establish the significance or etiology of an abnormal result, or to monitor the course of an AE should be obtained when clinically indicated. Any abnormal value that persists should be followed at the discretion of the Investigator.

17.8 Physical Examinations

At screening (Visit 0), a physical examination will be performed on the following body systems being described as **normal** or **abnormal**: general appearance, head and neck, eyes and ears,

nose and throat, chest, lungs, heart, abdomen, extremities and joints, lymph nodes, skin, and neurological.

A symptom-driven physical examination will be performed at all study Visits except the Screening Visit (Visit 0), i.e. only in case a symptom is reported by the subject/ legal representative(s), a system-based assessment will be performed for a detailed check of the affected body system(s). A symptom-driven examination should also be performed in case the subject has complaints within the observation time after vaccination (as described in 24.1, Visit 0 Screening)

A hand stiffness examination will be performed at all study Visits irrespective of any clinical signs or symptoms. The subject will be asked to bend simultaneously the four fingers of both hands, i.e. index, middle, ring, and little finger and the range of motion will be measured with a measuring device. Specifically, the distance between the fingers and the ball of the thumb should be measured in cm and recorded. The distance of the least flexible finger of each hand should be measured and recorded in the eCRF. Importantly, the same finger of each hand should be measured for subsequent visits. Special attention should be paid to measuring consistently to the same part of the ball of the thumb.

Abnormal conditions detected at screening or prior to vaccination at Visit 1 will be recorded as medical history. At all other study Visits, if a new abnormal or worsened abnormal pre-existing condition is detected, the condition will be recorded as an AE. A guidance document on the hand stiffness test is included in the Supplement Section (see Section 24.5).

17.9 Clinical Laboratory Parameters

Blood and urine samples will be obtained for assessment of clinical laboratory parameters as outlined in the Schedule of Study Procedures (see Section 24.2 and 24.3) or in the Screening and Study Visits Section (see Section 15.4). Parameters will be analyzed by either central or local laboratories according to the applicable laboratory SOP.

17.9.1 Safety Sample

A baseline safety laboratory blood [approx. 13mL] and urine sample will be obtained at Visit 0 (Screening Visit) from ALL subjects.

At subsequent visits (i.e. Visit 1 – 5), a Safety Sample consisting of clinical chemistry, hematology, coagulation and urinalysis will be taken from subjects of the immunogenicity subset only. In addition, a Safety Sample will be drawn from subjects during each acute/convalescent visit.

<u>Clinical chemistry</u> <u>(approx. 5 mL)</u>	Creatinine, sodium, potassium, calcium, aspartate transaminase (AST), alanine aminotransferase (ALT), alkaline phosphatase, bilirubin and C-reactive protein (CRP).
<u>Hematology panel</u> <u>(approx. 4 mL)</u>	Hemoglobin, hematocrit, erythrocyte count, WBC count, differential WBC count (basophils, eosinophils, lymphocytes, monocytes, neutrophils), platelets.
<u>Coagulation panel</u> <u>(approx. 4 mL)</u>	Small blood coagulation (prothrombin time, aPTT and fibrinogen).
<u>Urinalysis</u>	Standard urine dipstick for determining pH-value, specific gravity, leucocytes, nitrite, protein, glucose, ketones, urobilinogen, bilirubin, erythrocytes.

17.9.2 HBsAG/ HCV/ HIV Testing

An HBsAG/ HCV/ HIV Sample (approx. 5 mL) will be obtained from ALL subjects at Visit 0. A positive HIV test obtained by ELISA will have to be confirmed by a second method [e.g. Western blotting or PCR]. No HIV/HBsAg/HCV test needs to be performed if negativity has been established within the last 30 days prior to Visit 0.

17.9.3 CHIKV Screening

A CHIKV Baseline Screening Sample (approx. 1.5 mL) will be obtained from ALL subjects at Visit 0 (Screening Visit) for CHIKV-specific ELISA testing for stratification of subjects by baseline serostatus at the sites.

17.9.4 Arbovirus Screening

A baseline sample [approx. 5 mL] will be drawn from ALL subjects at Visit 1 (Day 1) for retrospective investigation of pre-existing antibodies including but not limited to other alphaviruses (i.e. Mayaro), Dengue or Zika by ELISA. Such assessments may occur at laboratories other than the laboratory used for analysis of safety samples.

17.9.5 Covid-19 Testing

A SARS-CoV-2 Antigen Rapid Test will be performed at Visit 0 (Screening Visit), Visit 1 (Day 1), Visit 2 (Day 8), Visit 3 (Day 29) and at an acute Visit. In case the SARS-CoV-2 Antigen

Rapid Test is positive, no confirmatory SARS-CoV-2 RT-PCR is required. In case the Rapid Test is inconclusive or failed, further tests including a confirmatory SARS-CoV-2 RT-PCR might be performed based on the investigator's judgement.

17.9.6 Assessment of Laboratory Values

Laboratory values will be evaluated according to the Toxicity Grading Scale for Healthy Adult and Adolescent Volunteers Enrolled in Preventive Vaccine Clinical Trials (Food and Drug Administration). For the individual toxicity criteria refer to Section 24.4.

Laboratory assessments for which no severity grading is described in Section 24.4 are graded as described in Section 17.2.1.1 upon Investigator's judgment.

The Investigator's assessment of each abnormal laboratory value, including its clinical significance, is to be recorded in the eCRF:

- Abnormal laboratory assessments that are considered clinically relevant, in the opinion of the Investigator, need to be documented as unsolicited AEs and assessed further for severity according to the toxicity grading scale provided in Section 24.4, causality and other assessments done for unsolicited AE (see Section 17.2.1).
- Abnormal laboratory assessments that are considered a symptom of an underlying AE or part of a syndrome that is reported as AE (e.g. presence of blood cells in urine in a person diagnosed with urinary tract infection) do NOT additionally need to be documented as unsolicited AE, but a respective comment should be added to the underlying AE.

Additional tests and other evaluations required to establish the significance or etiology of an abnormal laboratory result, or to monitor the course of an AE should be obtained when clinically indicated. Any abnormal value that persists should be followed at the discretion of the Investigator.

17.10 Viremia

All subjects will return to the study site at Day 8 (Visit 2), Day 29 (Visit 3), Month 3 (Day 85, Visit 4) and Month 6 (Day 180, Visit 5), and additionally at Month 12 (Visit 6) for the immunogenicity subset. Viremia samples will be collected throughout the study from ALL subjects for clinically indicated retrospective analysis [approx. 2.5 mL]. Subjects in the viremia subset will have viremia samples collected at Visit 1, 2 and 3; only if sample of Visit 2 is positive, Visit 3 sample will be analyzed. Subjects coming to an acute and convalescent visit will have a Viremia sample collected for retrospective analysis as outlined in Section 17.12.1.

Viremia will be analyzed in plasma samples. Blood will be collected by venous puncture. Samples will be shipped on dry ice at -70°C, viral RNA will be isolated and viral CHIKV RNA will be specifically amplified by RT-qPCR. The RT-qPCR targeting the nsp1 recognizes CHIK virus of different genotypes. For discrimination between wild type and vaccine virus, samples tested positive in the nsp1 specific RT-qPCR will be analysed for the presence of the deletion in nsp3 of VLA1553, if required.

17.11 Adverse Events of Special Interest (AESI)

In addition to nonspecific transient muscle pain and joint pain that may occur after vaccination with any vaccine, subjects will be carefully monitored for signs and symptoms similar to an acute stage CHIKV-associated event.

If a subject develops symptoms suggestive of CHIKV infection, he/she/ legal representative(s) will be asked to contact the site immediately for clinical evaluation at an unscheduled visit.

Therefore, the following cluster of symptoms with or without remissions or exacerbations will receive particular consideration and are defined as early onset AESI:

1. Fever ($\geq 37.8^{\circ}\text{C}$ measured axillary);

AND

2. Acute (poly)arthralgia/arthritis, myalgia, neurological symptoms (e.g. meningoencephalitis, acute encephalitis, headache, seizures), retinitis/uveitis;

OR

One or more of the following signs and symptoms: macular to maculopapular rash (sometimes with cutaneous pruritus (foot plant)), pigmentary changes, bullous rash/ skin blistering, purpura and ecchymosis;

AND

3. Onset of symptoms 2 to 21 days^{xvi} after vaccination (i.e. Day 3 – Day 22);

AND

4. Duration of event ≥ 3 days.

The cluster of symptoms defined above but starting 22 days after vaccination (i.e. Day 23) until study end is defined as late onset AESI.

^{xvi} The cluster of symptoms defined as early onset AESI starting 22 days after vaccination (i.e. Day 23) is defined as late onset AESI.

Any suspected clinical case of CHIKV-associated event shall be referred to a clinical expert, be evaluated according to standard diagnostic procedures and treated according to current medical standard and care until resolved or stabilized.

Additionally, subjects presenting with acute arthralgia will be followed up until resolution and monitored for recurrences throughout the study.

A blood sample for laboratory investigation will be taken upon presentation of the subject. Testing may include but is not limited to rheumatoid factor (RF), anticitrullinated protein antibody (ACPA), Ferritin and CRP. Retrospective investigation of a pre-vaccination sample may be considered for a thorough causality assessment.

Suspected CHIKV-associated events do not constitute a reason for withdrawal from the study.

17.12 CHIKV Case Ascertainment and Classification

An effort will be made to assess the incidence of naturally occurring CHIKV infections for the entire course of the study from Day 1 and will be compared between the study arms 14 days after vaccination for the exploratory assessment of efficacy (see Section 15.4.4).

The Investigator shall refer subjects with any clinical signs or symptoms characteristic or suggestive of an acute natural CHIKV infection or disease to a clinical expert, for evaluation according to standard diagnostic procedures and treatment according to current medical standard and care until resolved or stabilized.

All CHIKV infections and clinical manifestations of CHIKV will be discussed and assessed by the Sponsor and subsequently presented to an independent Data Safety Monitoring Board.

17.12.1 Classification of CHIKV Cases

Suspected cases of CHIKV infection/ disease will be classified into four different categories according to the criteria given below (PAHO/CDC 2011; Simon et al. 2015).

Following the end of the study, an attempt will be made to classify CHIKV infections into acute, post-acute and chronic stage of disease. The classification of these stages will be done based on the duration of symptoms. The acute stage is defined by symptoms until the first three weeks after onset of illness. The post-acute stage is defined as having symptoms until the end of the third month. The chronic stage is defined by symptoms that persist for more than three months.

17.12.1.1 Definite CHIKV Case

Any of the cluster of clinical manifestations of CHIKV events observed:

1. Fever ($\geq 37.8^{\circ}\text{C}$ measured axillary);

AND

2. Acute (poly)arthralgia/arthritis, myalgia, neurological symptoms (e.g. meningoencephalitis, acute encephalitis, headache, seizures), retinitis/uveitis;

OR

One or more of the following signs and symptoms: macular to maculopapular rash (sometimes with cutaneous pruritus (foot plant)), pigmentary changes, bullous rash/skin blistering, purpura and ecchymosis;

AND confirmatory laboratory tests:

- A retrospective confirmatory CHIKV-specific quantitative RNA detection (RT-qPCR) will be performed for all samples collected at acute and if applicable at convalescent visits.

17.12.1.2 Probable CHIKV Case

Any of the cluster of clinical manifestations of CHIKV events (as described above) observed that cannot be confirmed by RT-qPCR.

A confirmatory laboratory test (with acute and convalescent samples) will be conducted retrospectively:

- Seroconversion^{xvii} defined as a >4-fold increase of μPRNT_{50} compared to baseline (Day 1) for μPRNT baseline negative subjects and baseline positive subjects in the control group. In the VLA1553 treatment arm, it will not be possible to discriminate seroconversion induced by natural infection from vaccine induced within approx. 2 months after vaccination. Thereafter a more than 4-fold increase in neutralization titer could indicate natural exposure to circulating virus.

^{xvii} Acute (initial) and convalescent (follow-up) samples should be tested in parallel in order to avoid differences due to inter-assay variation

17.12.1.3 Asymptomatic CHIKV Case

Sera from subjects without apparent clinical symptoms of wt CHIKV disease will be retrospectively tested for antibodies in some instances. In these subjects a serological confirmation is required as applicable:

- In the control group, seroconversion is defined as a >4-fold increase of μPRNT_{50} compared to baseline (Day 1) at Month 6 and Month 12 for μPRNT baseline negative and baseline positive subjects.
- In the VLA1553 treatment arm, it will not be possible to discriminate seroconversion of CHIKV-specific neutralizing antibodies induced by natural infection or VLA1553 vaccination up to Day 85^{xviii}. Thereafter a more than 4-fold increase of μPRNT_{50} titer could indicate natural exposure to circulating virus.

17.12.1.4 Unconfirmed CHIKV Case

Unconfirmed cases are all suspected CHIKV cases that do not meet above criteria for CHIKV. Unconfirmed cases will not be included in the assessment of efficacy.

17.13 Adverse Event Reporting Procedures

17.13.1 Serious Adverse Event

Any SAE should be reported to the Safety Desk by fax or email within 24 hours after the Investigator has become aware of the event. Under certain circumstances the initial notification could be done by phone, but nevertheless a written SAE Report Form has to be submitted to the Safety Desk within 24 hours (see Section 4).

Correct SAE reporting will have to cite a diagnosis or a symptom. Any diagnosis and any symptom is regarded as separate SAE. However, if the Investigator considers several symptoms to be in the context of one underlying diagnosis, he/she may specify the diagnosis as the reportable SAE and describe the attendant symptoms in one single appropriate SAE report.

Medical or diagnostic procedures due to an underlying disease or symptom are not considered an AE but a consequent measure following an AE. A correct SAE report will therefore have to

^{xviii} Depending on actual titer kinetics in the study, this cut-off time point may be revisited.

specify the disease or symptom as the reportable AE and the medical or diagnostic procedure as action taken.

In addition, expedited and periodic reporting to Competent Authorities and IRBs will be performed in accordance with local requirements. Further reporting details can be found in the study-specific SAE procedure which is in accordance with respective US/EU requirements, International Conference on harmonization (ICH) GCP, national laws and site-specific requirements. SAEs that are considered as probably or possibly related and additionally are unexpected need to be reported according to the requirements for suspected unexpected serious adverse reactions (SUSARs).

SAE reports will be reviewed by a study site's physician, the Safety Desk, the Study Medical Monitor, the Sponsor and the independent DSMB.

Beyond study end, SAEs that are fatal, life-threatening or suspected to be related to study treatment will continue to be reported until 6 months after the last study visit of the respective subject (i.e. Visit 5 or Visit 6, respectively).

17.13.2 Adverse Events of Special Interest (AESI)

Any AESI should be reported to the Safety Desk by fax or email within 48 hours after the Investigator has become aware of the event. Under certain circumstances the initial notification could be done by phone, but nevertheless a written AESI Report Form has to be submitted to the Safety Desk within 48 hours (see Section 5).

Subjects will be carefully monitored for development of AESIs. A cluster of symptoms (see 17.11) associated with CHIKV infection, are defined as AESI. In case an AESI is identified, the Investigator will complete the AESI Report Form with all available information including medical records. This information will be provided to the DSMB. The DSMB will perform a thorough review of each case and advise whether additional clinical work-up is required.

The DSMB will conduct a final adjudication of all AESIs and will assess whether cases were new in onset and whether there is any relationship to administration of the study vaccine. Narratives with detailed case descriptions will be provided for all AESIs.

17.13.3 Pregnancy

The risk of maternal to fetal transmission of Chikungunya virus during pregnancy and transmission of CHIKV via semen cannot be excluded. Thus, female subjects of childbearing potential and female partners from study participants must not become pregnant during the first three months post-vaccination. Contraceptive methods for all subjects of reproductive potential will be provided by the sponsor.

Reporting requirements start with administration of the vaccination until study completion (or ET Visit). All pregnancies that occur during the clinical study period will be followed-up for three months after delivery or termination of the pregnancy. Any effect on either mother or fetus should be determined. A pregnancy which led to a congenital anomaly/birth defect must be followed-up by the Investigator longer or until resolution or stabilization. Duration of prolonged follow-up will be decided on an individual basis and in accordance with the Sponsor. The Investigator will prepare a narrative on the course of the pregnancy and the outcome.

The Investigator should report pregnancies within 24 hours of being notified using the Pregnancy Report Form. Reporting procedures are similar to SAE reporting procedures (contacts and processing), although a pregnancy is not considered an SAE.

If a seriousness criterion applies in addition to the pregnancy (e.g. hospitalization, congenital anomaly/birth defect) the pregnancy qualifies as an SAE. In such case a Pregnancy Report Form and an SAE Report Form have to be filled out (see Section 4 and Section 6).

17.14 Safety Monitoring

17.14.1 Data Safety Monitoring Board

An independent Data Safety Monitoring Board (DSMB) will be utilized for this study. The DSMB will consist of four voting members who will be selected based upon their expertise with and understanding of infectious diseases, vaccines, clinical research and/or skills and knowledge in clinical medicine. The DSMB will meet to review accumulating safety data on a regular basis until all subjects have received the vaccination at Day 1 and until all subjects have completed Visit 3 (Day 29). During these meetings the DSMB will review listings of SAEs, AESIs, Deaths and severe (Grade 3) solicited AEs.

The DSMB will periodically review accruing safety information throughout the study, as applicable. A meeting of the DSMB may be called at the discretion of the Sponsor, e.g. to address any safety concerns arising during the conduct of the study.

A DSMB meeting is triggered if criteria for a potential safety concern (as described in Section 12.1) during recruitment of sentinel subjects of Cohort I or II are met. The DSMB will review accruing safety data and decide whether to proceed with the vaccinations of the same Cohort and if recruitment for the Cohort II can be started without limitation.

Following assessment and presentation of data by the Sponsor, the DSMB will confirm diagnosis of suspected cases of natural CHIKV infection/ disease based on the established case definitions (see section 17.12), supported by medical records received from the Investigator after clinical workup.

A quorum of three DSMB voting members is required for a valid vote. If opposing votes are even, the vote of the DSMB chair will be decisive. A DSMB charter including a detailed description will be prepared.

Responsibilities of the DSMB

- Provides independent monitoring of safety issues, which means it reviews and evaluates all SAE reports and study discontinuations for: (i) increases in frequency of SAEs and study discontinuations within the study; and (ii) SAEs in the study sample compared with the population based on what is known from the literature;
- Reviews data produced from the study upon the Sponsor's request to determine whether the conditions on which study design is based have remained the same or have changed. If changed, the DSMB will suggest whether or not the changes mandate changes to the protocol and suggest a protocol amendment;
- Upon the Sponsor's request, meets for discussion and gives recommendations to the Sponsor as to whether the study should progress unchanged, or the study requires changes, or the study should be terminated prematurely;
- Can propose an unplanned safety analysis of clinical trial data;
- Can suggest unscheduled visits for specific evaluations for individual cases reviewed.

17.14.2 Sponsor

Until the last subject reached Day 29, listings of available blinded safety data will be closely reviewed by the Sponsor to identify any potential safety concerns.

17.14.3 Investigator

To ensure information exchange on safety across sites, Investigators will be provided with safety information pertaining to all severe (Grade 3) AEs and SAEs reported in the eCRF.

18. STATISTICS

18.1 Sample Size and Power Calculations

The total number of 500 subjects exposed to VLA1553 in this study has been selected to provide a sufficient number of subjects for proper safety evaluation in the adolescent's subgroup. With 500 subjects exposed, the study will provide 95% confidence that an AE does not occur at a frequency of 1:166 or 0.6% or higher, if not observed in the study.

The immunogenicity subset of 268 VLA1553-vaccinated ELISA baseline seronegative subjects will allow for sufficient statistical power when applying a one-sided exact binomial test with a significance level of 2.5% against a non-acceptance threshold of 70% on the proportion of subjects with a seroprotective level (defined as $\mu\text{PRNT}_{50} \geq 150$ for μPRNT baseline seronegative subjects) at Day 29. A seroprotection rate (SPR) of 80% is assumed, and 200 VLA1553-vaccinated subjects would thus be necessary for a statistical power of 90%. With an expected drop-out/major protocol deviations rate of approximately 10%, at least 223 seronegative subjects vaccinated with VLA1553 need to be allocated to the immunogenicity subset.

Statistical analyses will be based on μPRNT serostatus. ELISA CHIKV results will be used for enrollment at the sites only.

18.2 Datasets and Analysis Cohorts

The safety analysis population contains all subjects who entered into the study and received one vaccination. Subjects will be analyzed as treated.

The immunogenicity analysis population (IMM) is defined to include all randomized and vaccinated subjects of the immunogenicity subset who have evaluable μPRNT antibody titer results at baseline and at least one post-baseline titer measurement after vaccination. Subjects will be analyzed according to the study arm they had been allocated to, rather than by the actual treatment they received.

The per protocol analysis population (PP) contains all IMM subjects who have no major protocol violations that could impact immune response. Examples that may lead to exclusion from the PP are provided here, further criteria may be defined in the SAP:

- Subject has a history of immune-mediated or clinically relevant arthritis/arthralgia;
- Subject has a known or suspected defect of the immune system that can be expected to influence the immune response to the vaccine, such as subjects with congenital or acquired immunodeficiency, including infection with HIV, status post organ transplantation or immuno-suppressive therapy within 4 weeks prior to Visit 1. Immuno-

suppressive therapy is defined as administration of chronic (longer than 14 days) prednisone or equivalent ≥ 2 mg/kg/day within 4 weeks prior to study entry, radiation therapy or immunosuppressive cytotoxic drugs/ monoclonal antibodies in the previous 3 years; topical and inhaled steroids are allowed;

- Subject is positive for human immunodeficiency virus (HIV), hepatitis B surface antigen (HBsAg) or hepatitis C virus (HCV);
- Subject has received the wrong (not according to randomization) or no IMP.

These criteria for protocol violations are identified at the time of planning the study. However, during the course of the trial unforeseen events may occur or new scientific knowledge may become available, therefore final decisions on whether any protocol violation could impact immune response and thus lead to exclusion from the PP will be made by the sponsor on a case by case basis in a blinded manner (prior to study unblinding). Sample testing issues may also lead to exclusion from the PP for particular time points.

Subjects will be analyzed in the PP according to their actual treatment.

18.3 Handling of Missing, Unused, and Spurious Data

All statistical analysis will generally be based on observed values, missing values will not be imputed. In case of >5% of missing values for an immunogenicity comparison involving a statistical test, multiple imputation methods will be applied in order to evaluate the possible impact of missing values on these results.

18.4 Methods of Analysis

A statistical analysis plan will be prepared before database closure/snapshot.

18.4.1 Immunogenicity Analysis

All analyses of immunogenicity data will be performed primarily on the PP and secondarily on the IMM.

The primary immunogenicity analysis will be a comparison of the observed proportion of baseline seronegative subjects (based on μ PRNT) with a seroprotective CHIKV antibody level (defined as μ PRNT₅₀ ≥ 150) at Day 29 (i.e. 28 days post-vaccination) against a non-acceptance threshold of 70%. An exact binomial test for the null-hypothesis H0: SPR $\leq 70\%$ against the alternative H1: SPR $> 70\%$ with a one-sided significance level of 2.5% will be applied and exact (Clopper-Pearson) two-sided 95% confidence limits will be calculated.

Secondary immunogenicity analysis will include the comparison of the GMTs and GMFIs for various study days between the VLA1553 and control group by visit using ANOVA (factor study

group, covariate baseline serostatus based on μ PRNT). This will be done using log10 transformed data and taking the anti-log of the resulting point estimates for the least squares means, least squares means differences and the corresponding 95% CI. In addition, sensitivity analyses (ANOVAs with factors study site, treatment group, study site*treatment group, baseline μ PRNT serostatus) will be performed for selected comparisons.

In addition, the seroprotection/seroconversion rates and proportion of subjects reaching an at least 4-fold, 8-fold, 16-fold or 64-fold increase in CHIKV-specific neutralizing antibody titer compared to μ PRNT baseline for various study days will be compared between the study arms by Fisher's exact test and exact 95% confidence intervals will be calculated.

Immunogenicity analyses will be generated stratified by μ PRNT baseline serostatus (Day 1): μ PRNT₅₀ > 40 for seropositive subjects and μ PRNT₅₀ ≤ 40 for seronegative subjects.

18.4.2 Safety Analysis

All analyses of safety data will be performed on the safety analysis population. Safety analysis will generally be generated overall and stratified by μ PRNT baseline serostatus (Day 1): μ PRNT₅₀ > 40 for seropositive subjects and μ PRNT₅₀ ≤ 40 for seronegative subjects.

Safety tabulations will generally be provided separately for solicited AEs and unsolicited AEs, and for both types of AEs combined. 95% confidence intervals according to Altman will generally be provided for all AE rates and differences between study groups will be assessed for significance using Fisher's exact test.

The number and percentage of subjects with any AE, any solicited AE, unsolicited AE, any related unsolicited AE, any related severe AE, any SAEs, any related SAEs, any medically attended AE, any AE leading to withdrawal from study, and any AE occurring at a frequency of at least 10% and at least 1% in at least one study arm, up to Day 29, Day 85 and up to Day 180, and any AESI (i.e. early and late onset AESI) and any related AESI up to Day 21, will be presented for each study arm, overall and by system organ class/preferred term.

The number and percentage of subjects with solicited local and systemic AEs within 10 days after vaccination will be presented. Differences between the study arms will be assessed for significance using Fisher's exact test. The occurrence of solicited local and systemic AEs will also be tabulated by subject diary Day 10.

Changes in laboratory values from study entry will be analyzed descriptively and will be part of the unsolicited AE evaluation only in case of clinically relevant deviations. The rates of subjects with laboratory assessments outside the normal range, and with abnormal laboratory parameters falling into the grade 0 vs. 1 through 3 will be calculated by visit and overall. The rate of subjects with urinalysis results according to the test manufacturer's results categories will be calculated.

18.4.3 Exploratory Analysis

All occurrences of possible CHIKV infections and clinical manifestations will be analyzed based on Classification of CHIKV cases (Section 17.12.1). Analysis will be provided based on the level of diagnostic certainty: (1) Including definite, probable and asymptomatic CHIKV cases, (2) Including definite and probable CHIKV cases and (3) Including definite cases only. Providing analysis that exclude asymptomatic cases will serve as a sensitivity analysis that excludes the potential bias stemming from not being able to determine seroconversion due to wt CHIKV exposure in the VLA1553 group.

The proportion of subjects with CHIKV cases as lined out above will be compared between the study arms by Fisher's exact test and exact 95% confidence intervals will be calculated. The conduct of and extent of analysis will be re-confirmed during the Blind Data Review Meeting in light of the number of confirmed CHIKV cases.

18.5 Planned Data Analysis of the Study

The following data analyses will be performed:

- Part A includes safety and immunogenicity data after all subjects have completed Visit 3 (Day 29).
- Part B includes safety and immunogenicity data after all subjects have completed Visit 5 (Month 6).
- Part C includes safety and immunogenicity data after all subjects in the immunogenicity subset have completed Visit 6 (Month 12).

Individual study parts will be analyzed sequentially.

The Part A analysis will be performed once the last subject has completed the study Visit 3, i.e. Day 29. Part B and C analysis will be performed once the last subject has completed the study Visit 5, i.e. Month 6, or study Visit 6, i.e. Month 12, respectively. Part A will be unblinded (blind will be maintained for study sites) and serves as primary endpoint to provide early analysis of vaccine efficacy (VE).

A Clinical Study Report will be compiled following each data analysis.

19. ETHICS AND REGULATORY ASPECTS

19.1 Compliance Statement

This study will be conducted in accordance with this protocol, current ICH/GCP guidelines, Declaration of Helsinki, and with the applicable national and local regulatory requirements.

19.2 Institutional Review Board (IRB) and Regulatory Authorities

Before enrollment of adolescent subjects into this study, the protocol, informed consent/ assent form, any promotional material/advertisements, and any other requested information will be reviewed and approved/given favorable opinion by the IRB and applicable regulatory authorities in accordance with local requirements. The study will commence only upon the Sponsor's receipt of approval/favorable opinion from the IRB.

If the protocol and/or any other information given to the subject/ legal representative(s) is/are amended, the revised document(s) will be reviewed and approved/given favorable opinion by the IRB and applicable regulatory authorities in accordance with local requirements, where applicable. The protocol amendment will only be implemented upon the Sponsor's receipt of approval. Amendments that are intended to eliminate an apparent immediate hazard to subjects may be implemented prior to receiving IRB and authority approval. However, in this case, approval must be obtained as soon as possible after implementation.

19.3 Subject Information and Informed Consent/ Assent

It is the Investigator's responsibility to obtain freely given written or electronic informed consent from the subject's legal representative(s), as required by local regulations, and the subject's written or electronic assent, depending on the subject's age and capability to understand the aims, methods, anticipated benefits and potential hazards of the study. Written or electronic informed consent/assent has to be obtained before the subject is exposed to any study-related procedures, including screening tests for eligibility. Subjects turning 18 years within the study will be asked to re-consent.

The Investigator will explain that the subjects/ legal representative(s) are completely free to refuse to enter the study or to withdraw from it at any time, without any prejudice and need for justification. The subject's legal representative(s) and the subject will be informed that representatives of the Sponsor and health authority inspector may review their source records, and that these persons are bound by confidentiality obligations.

The informed consent /assent form will include a comprehensive explanation of the proposed treatment without any exculpatory statements, in accordance with the elements required by

ICH GCP and applicable regulatory requirements. Volunteers will be allowed sufficient time to consider participation in the study after having the nature and risks of the study explained to them and their legally authorized representative. By signing the informed consent/assent form, volunteers agree that all evaluations required by the study will be completed, unless they withdraw voluntarily or are terminated from the study for any reason.

The subject's legal representative(s) and the subject, as applicable, will be given a printed copy or an electronic version of the signed informed consent/assent documentation. The original of the signed and dated informed consent/assent must be retained in the site's records, and is subject to inspection by representatives of the Sponsor, or representatives from regulatory agencies.

Electronic consent/assent must be sent individually to participants and guardians in order to avoid misidentifying participants. According to requirements of CONEP circular letter No. 23/2022, the electronic consent/assent must be stored electronically, in a secure and confidential manner, ensuring the integrity of the document and accessibility for monitoring/audits. To ensure traceability, the site must record in the source document that the consent was signed electronically.

The Sponsor will provide to the Investigator in written form any new information that significantly bears on the subjects' risks associated with study vaccine exposure. The informed consent/assent form will be updated, if necessary. This new information and/or revised informed consent/assent form, that has been approved by the applicable IRB and regulatory authorities, where applicable, will be provided by the Investigator to the subjects and their legal representative(s) who consented to participate in the study.

20. QUALITY CONTROL AND QUALITY ASSURANCE

20.1 Source Data and Records

Source data are defined as all information related to clinical findings, observations or other activities in the study, captured in original records or certified copies of original records. The Investigator will permit study-related monitoring, audits, IRB review and regulatory inspections, by providing direct access to source data/records. Source records should be preserved for the maximum period of time required by local regulations.

Source data entries must be made in accordance with local requirements. Signed and dated copies of the laboratory result reports have to be kept within the subject's source data file.

eCRFs will not be used as source data for any other variable.

20.2 Investigator's Responsibility

The Investigator will comply with the protocol (which has been approved/given favorable opinion by the IRB), ICH GCP, and applicable regulatory requirements. The Investigator is ultimately responsible for the conduct of all aspects of the study at the study site and verifies by signature the integrity of all data transmitted to the Sponsor. The term "Investigator" as used in this protocol, and in study documents refers to the Investigator or authorized study personnel whom the Investigator has designated to perform certain duties. Sub-investigators or other authorized study personnel are eligible to sign for the Investigator, except where the Investigator's signature is specifically required.

20.3 Training

The study monitor will ensure that the Investigator and study site personnel understand all requirements of the protocol, the investigational status of the vaccine, and his/her regulatory responsibilities as an Investigator. Training may be provided at an Investigator's meeting, at the study site, and/or by instruction manuals. In addition, the study monitor will be available for consultation with the Investigator and will serve as the liaison between the study site and the Sponsor.

20.4 Monitoring

A designated monitor will check electronic system data and source data at regular intervals throughout the study to verify completeness, accuracy and consistency of the data, protocol adherence, and adherence to GCP guidelines. The monitor will work and perform Source Data Verification according to the Clinical Management Plan. The Investigator will cooperate with the monitor to ensure that any discrepancies identified are resolved.

20.5 Audit and Inspection

Upon request, the Investigator will make all study-related source data and records available to a qualified quality assurance auditor mandated by the Sponsor or to regulatory inspectors. The main purposes of an audit or inspection are to confirm that the rights and welfare of the subjects have been adequately protected, and that all data relevant for the assessment of safety and efficiency of the investigational product have appropriately been reported to the Sponsor.

20.6 Non-compliance with the Protocol / Protocol Deviations from the Protocol

Any deviations from the protocol will be tracked, actions defined, as feasible, and reviewed in Data Review Meetings for the study part analysis and the final analysis for assessment of their influence on the quality of the study analysis.

20.7 Confidentiality of Subject's Data

The Investigator will exercise all reasonable precautions within the constraints of the applicable regulatory requirements to maintain the confidentiality of subjects' identities. On exported electronic source data or any other documents submitted to the Sponsor, subjects will only be identified by subject number. Documents not for submission to the Sponsor, e.g. subject identification log and original ICF/ assent form, will be maintained by the Investigator in strict confidence.

21. DATA HANDLING AND RECORD KEEPING

21.1 Information of Investigators

An IB containing all important data relating to the safe use of the IMP will be supplied to the Investigator prior to study start.

The Investigator will be kept informed on new relevant safety data as the study proceeds.

21.2 Electronic Case Report Forms (eCRFs)

21.2.1 Data Recorded Directly on Case Report Forms

An electronic Case Report Form (eCRF) will be used for this study. Data will be recorded directly onto source documents before documentation in the eCRF.

21.2.2 eCRF entries

eCRF entries and corrections will only be performed by study site staff authorized by the Investigator. Each user is informed of the clinical study's web-site internet address and is allocated to a user account with personal password to access the confidential website. The personal password must be kept confidential and must only be used by the person to whom it was assigned. For additional authorized users at the site, a new user account has to be requested to ensure that each entry/change can be allocated to the person who performed the entry/change.

All visit data need to be recorded in the eCRF database as soon as possible after each study visit, no later than 1 business day after data has been collected.

21.2.3 Changes to eCRF data

Corrections may be requested as follows:

- Investigators' responses are checked as they are entered and are rejected if they do not fulfill quality criteria. A message will specify the type of error or syntax error and assist in its correction.
- If required, the CRA can ask for information to be corrected during monitoring.
- Computerized data-check programs and manual checks will identify clinical data discrepancies for resolution. Corresponding queries will be created within the data capturing system and the site will be informed about new issues to be resolved on-line.

All discrepancies will be solved on-line directly by the Investigator or by authorized staff.

Corrections of eCRF data may be performed by authorized staff only. The person performing the changes in the eCRF is required to electronically confirm the changes made.

21.2.4 eCRF Entry Validation

The Investigator will thoroughly review the data on the eCRF, and will finally certify the contents of the eCRF by electronic signature after completion of each subject. If a correction is made to the eCRF data after the Investigator's final approval, the certification must be repeated after the changes have been performed.

21.2.5 Data Collection

All visits and assessments are entered into an interactive form. eCRFs will be source document verified following guidelines established before study onset and detailed in the Monitoring Plan. Maintenance of the study database will be performed. Details to eCRF handling are provided in a study specific eCRF manual.

21.2.6 Coding of Adverse Events, Drugs and Diseases

After data entry, AEs and medical history will be coded according to the latest MedDRA version. The same MedDRA version will be applied to all study parts. Previous and concomitant medication and vaccines will be coded according to the latest version of the WHO Drug Reference List and Anatomical Therapeutic Chemical (ATC) Classification System.

21.3 Investigator File

21.3.1 Maintenance

The Investigator will maintain complete and accurate study documentation in a separate file (i.e. Investigator File) provided during the initiation visit. The Investigator is responsible for maintaining complete, up to date and accurate study records to enable the conduct of the study to be fully documented. The records should include the clinical protocol as well as any amendments, study approval letters, all original ICFs, drug dispensing and accountability logs and all relevant correspondence pertaining to the study.

21.3.2 Archiving and Destruction

All study-related documents should be kept by the Investigator for the maximum period of time required by local regulations. No study document should be destroyed without prior written agreement between the Investigator and the Sponsor. Should the Investigator elect to assign the study documents to another party, or move them to another location, the Sponsor must be notified.

21.3.3 Provision of Additional Information

On request, the Investigator will supply the Sponsor with additional data relating to the study or copies of relevant source records, duly anonymized. In case of particular issues or governmental queries, it is also necessary to have access to the complete study records, provided that the subject's confidentiality is protected in accordance with applicable regulations.

22. PUBLICATION POLICY

All results generated in this study will be considered to be strictly confidential. The Investigator may not submit the results for publication or presentation without prior written permission of the Sponsor. Authorship for any publication will be determined in mutual agreement. Within the scope of publication, co-authorship may be offered, at the sole discretion of the Sponsor, on a case-by-case basis taking scientific contribution into consideration. This is according to uniform requirements for manuscripts submitted to biomedical journals proposed by the International Committee of Medical Journal Editors.

All results of this study will be made publicly available and published in accordance with globally accepted standards, in particular CEPI's publication policy

23. LIABILITIES AND INSURANCE

In case of any damage or injury occurring to a subject in association with the participation in the study, insurance has been contracted.

The name, address and the insurance policy number will be given to both the Investigator prior to enrollment. Moreover, a copy of the insurance conditions will be filed on site.

The Investigator is responsible for dispensing the investigational product according to this protocol, and for its secure storage and safe handling throughout the study.

24. SUPPLEMENTS

24.1 Study Flow Chart

Figure 24.1-1 Study Design for Clinical Study VLA1553-321

M = month;

24.2 Schedule of Study Procedures and Assessments – Parts A, B and C

		Part A			Part B		Part C	ET
Procedures/Assessments	Visit 0 Screening (Day -28 to Day 0)	Visit 1 ¹ Day 1	Visit 2 Day 8 (+/- 1d)	Visit 3 Day 29 M1 (+/- 4d)	Visit 4 Day 85 M3 (+/- 7d)	Visit 5 Day 180 M6 (+/- 14d)	Visit 6 ⁿ Day 365 M12 (+/- 14d)	Visit ET
Informed consent/ assent ^a	X							
Inclusion/Exclusion criteria	X	X (Review)						
Demographics ^b	X							
Medical history ^c (including vaccination history)	X	X (Update)						
Randomization		X						
Prior/ Concomitant medications	X	X	X	X	X	X	X ⁿ	X
Physical examination and Hand Stiffness Test ^d	X	X	X	X	X	X	X ⁿ	X
Vital signs ^e	X	X						
HIV ^f / HbsAg / HCV test [approx. 5 mL]	X							
Arbovirus Screening ^g [approx. 5 mL]		X						
CHIKV Screening [approx. 1.5 mL]	X							
Serum/Urine Pregnancy test ^h	X	X		X	X	X	X ⁿ	X

AE/ AESI/ SAE Assessment		X	X	X	X	X	X ^m	X ^m

ET.....early termination; R.....review; C.....collect; D.....distribute

^a Occurs at enrollment before Screening.

^b Demographics include full date of birth, height, weight, BMI, gender, race and ethnicity.

^c Symptoms noted at Visit 1 (prior to first vaccination) are not considered AEs, but will be recorded as medical history. Prior vaccination against relevant traveler vaccines should be documented in the Medical History, i.e. YF and JEV.

^d At the screening visit, a physical examination will be performed on the following body systems being described as normal or abnormal: general appearance, head and neck, eyes and ears, nose and throat, chest, lungs, heart, abdomen, extremities and joints, lymph nodes, skin, and neurological. At subsequent indicated visits, a symptom-driven physical examination will be performed, i.e. only in case a symptom is reported by the subject, a symptom-based assessment of the affected body system(s) will be performed. A hand stiffness and mobility examination will be performed at all study visits irrespective of prior symptoms.

- ^e Vital signs will include systolic and diastolic blood pressure and pulse rate while seated and at rest, and body temperature measured axillary before vaccination. In addition, after an observation period of 60 minutes following vaccination pulse rate as well as blood pressure while seated and at rest will again be assessed.
- ^f The results of negative HIV tests that were performed up to 30 days before Visit 0 are acceptable. A positive HIV test obtained by ELISA will have to be confirmed by a second method (e.g. Western blot or PCR) [blood (for all tests): 5 mL].
- ^g A panel of arboviruses will be tested by ELISA (i.e. Mayaro, Dengue, Zika) [blood: 5 mL].
- ^h A **serum** pregnancy test will be performed for all female subjects of childbearing potential at the screening visit only and a **urine** pregnancy test will be done prior to vaccination at Visit 1 and at indicated visits.
- ⁱ Blood draw [approx. 5 mL] for CHIKV-specific neutralizing antibody titer evaluation and development of further assays from ALL subjects.
- ^j Safety laboratory sample obtained from ALL subjects at Day 0 (Screening visit). At Visits 1 – 5 Safety Sample obtained in the immunogenicity subset ONLY for standard clinical chemistry, hematology, coagulation and urinalysis [EDTA blood: approx. 13 mL].
- ^k Viremia plasma sample obtained from ALL subjects for clinically indicated retrospective investigation of viremia by RT-qPCR [blood: approx. 2.5 mL].
- ^l All procedures/assessments (apart from Subject Diary distribution and AE assessment) occur prior to vaccination (unless stated otherwise).
- ^m Only SAE assessment will occur at this visit. No AE assessment.
- ⁿ For immunogenicity subset only.
- ^o In the Viremia subset, samples will be analyzed for investigation of viremia by RT-qPCR at Visit 1 and 2, if sample of Visit 2 is positive, a Visit 3 sample will be analyzed [blood: 2.5 mL].
- ^p Viremia plasma sample obtained ONLY from immunogenicity subset for clinically indicated retrospective investigation of viremia by RT-qPCR.
- ^r Only if the ET visit occurs prior to Day 29, a viremia plasma sample should be obtained from ALL subjects for clinically indicated **retrospective** investigation of viremia by RT-qPCR.

24.3 Schedule of Study Procedures and Assessments – Acute Visit, Convalescent Visit

	Acute Visit Day 1-7 after reported fever	Convalescent Visit Week 3 after Acute Visit
Clinical CHIKV assessment	X	X
Prior/ Concomitant medications	X	X
Physical examination and Hand Stiffness Test	X	X
Urine Pregnancy test ^e	X	X
Immunogenicity [approx. 5 mL] ^b	X	X
Safety Sample [approx. 13 mL]	X	X
Viremia [approx. 2.5 mL] ^a	X	X
RT-PCR [approx. 5 mL] ^c	X	
ELISA [approx. 5 ml] ^d	X	X
SARS-CoV-2 Antigen Rapid Test	X	
VACCINATION		
Subject Diary	R/C	
Memory Aid	R/C/D	R/C/D
Safety Card	D	D
Pregnancy Diary ^e	R/C/D	R/C/D
AE/ AESI/ SAE Assessment	X	X
R.....review; C.....collect; D.....distribute		
^a Assessment of CHIK-specific viremia by RT-qPCR in plasma for retrospective analysis. ^b CHIKV seroconversion will be assessed by μ PRNT in paired acute/convalescent samples. ^c Assessment of CHIK, ZIKA and Dengue viremia by RT-PCR in plasma for treatment according to current standard of care. ^d ELISA testing against CHIK, ZIKA and Dengue for treatment according to current standard of care. ^e For females of reproductive potential		

24.4 Toxicity Grading Scale for Abnormal Laboratory Assessments

	Mild (Grade 1) ¹	Moderate (Grade 2)	Severe (Grade 3)	Potentially life threatening (Grade 4) ^{2,6}
Hematology Parameters				
Hemoglobin (Female) - gm/dL	11.0 – 12.0	9.5 – 10.9	8.0 – 9.4	<8.0
Hemoglobin (Male) – gm/dL	12.5 – 13.5	10.5 – 12.4	8.5 – 10.4	<8.5
Hematocrit	Outside normal range ³			
Erythrocyte count	Outside normal range ³			
WBC Increase - cell/mm ³	10,800 – 15,000	15,001 – 20,000	20,001 – 25,000	>25,000
WBC Decrease - cell/mm ³	2,500 – 3,500 ⁴	1,500 – 2,499	1,000 – 1,499	<1,000
Neutrophils Decrease - cell/mm ³	1,500 – 2,000	1,000 – 1,499	500 – 999	<500
Lymphocytes Decrease - cell/mm ³	750 – 1,000 ⁴	500 – 749	250 – 499	<250
Monocytes	Outside normal range ³			
Eosinophils cell/mm ³ -	650 – 1500 ⁴	1501 - 5000	> 5000	Hyper- eosinophilic
Basophils	Outside normal range ³			
Platelets Decreased - cell/mm ³	125,000 – 140,000 ⁴	100,000 – 124,000	25,000 – 99,000	<25,000
Clinical Chemistry Parameters				
Creatinine – mg/dL	1.5 – 1.7 ⁴	1.8 – 2.0	2.1 – 2.5	>2.5 or requires dialysis
Sodium – Hyponatremia mEq/L	132 – 134 ⁴	130 – 131	125 – 129	<125
Sodium – Hypernatremia mEq/L	144 – 145 ⁴	146 – 147	148 – 150	>150
Potassium – Hyperkalemia mEq/L	5.1 – 5.2 ⁴	5.3 – 5.4	5.5 – 5.6	> 5.6
Potassium – Hypokalemia mEq/L	3.5 – 3.6 ⁴	3.3 – 3.4	3.1 – 3.2	<3.1
Calcium – Hypocalcemia mg/dL	8.0 – 8.4 ⁴	7.5 – 7.9	7.0 – 7.4	<7.0
Calcium – Hypercalcemia mg/dL	10.5 – 11.0 ⁴	11.1 – 11.5	11.6 – 12.0	>12.0
AST – increase by factor	1.1 – 2.5 x ULN ⁵	2.6 – 5.0 x ULN	5.1 – 10 x ULN	>10 x ULN
ALT – increase by factor	1.1 – 2.5 x ULN	2.6 – 5.0 x ULN	5.1 – 10 x ULN	>10 x ULN
Alkaline phosphatase – increase by factor	1.1 – 2.0 x ULN	2.1 – 3.0 x ULN	3.1 – 10 x ULN	>10 x ULN
Bilirubin – when accompanied by any increase in Liver Function Test increase by factor	1.1 – 1.25 x ULN	1.26 – 1.5 x ULN	1.51 – 1.75 x ULN	>1.75 x ULN
Bilirubin – when Liver Function Test is normal; increase by factor	1.1 – 1.5 x ULN	1.6 – 2.0 x ULN	2.0 – 3.0 x ULN	> 3.0 x ULN
CRP	Outside normal range ³			
Coagulation Factors				
PT – increase by factor (prothrombin time)	1.0 – 1.10 x ULN ⁵	1.11 – 1.20 x ULN	1.21 – 1.25 x ULN	> 1.25 ULN
PTT (aPTT) – increase by factor (activated partial thromboplastin time)	1.0 – 1.2 x ULN	1.21 – 1.4 x ULN	1.41 – 1.5 x ULN	> 1.5 x ULN

IND No: 17854

	Mild (Grade 1)¹	Moderate (Grade 2)	Severe (Grade 3)	Potentially life threatening (Grade 4)^{2,6}
Fibrinogen increase - mg/dL	400 – 500 ⁴	501 – 600	> 600	--
Fibrinogen decrease - mg/dL	150 – 200 ⁴	125 – 149	100 – 124	< 100 or associated with gross bleeding or disseminated intravascular coagulation (DIC)
¹ In case the laboratory's normal ranges and absolute Grade 1 limits overlap, Grade 1 limits will prevail, i.e. the value will be classified as Grade 1 abnormality even if it is within laboratory normal ranges. Values between the laboratory normal ranges and absolute Grade 1 limits will be reported as no abnormality (Grade 0). ² The clinical signs or symptoms associated with laboratory abnormalities might result in characterization of the laboratory abnormalities as Potentially Life Threatening (Grade 4). For example, a low sodium value that falls within a grade 3 parameter (125-129 mEq/L) should be recorded as a grade 4 hyponatremia unsolicited AE if the subject had a new seizure associated with the low sodium value. ³ As neither the FDA Scale nor the Division of AIDS Table for Grading the Severity of Adult and Pediatric Adverse Events (December 2004) provide any grading for Hematocrit, Erythrocyte count, Monocytes, Basophils, and CRP, these will only be analyzed as "outside normal range", as determined by laboratory standards and graded as described in Section 17.2.1.1 upon investigator's judgement. ⁴ Laboratory values should be adjusted to FDA toxicity grading scale. Specifically, if laboratory reference range is more stringent than FDA toxicity grading scale the laboratory values should be reported as no abnormality (Grade 0). Similarly, if laboratory values are within the laboratory normal reference range, but fall into FDA toxicity grading scale, the values should be reported as indicated by the FDA toxicity grading scale. ⁵ "ULN" is the upper limit of the normal range ⁶ Any grade 4 abnormal laboratory value should be reported as an SAE (see Section 16.1.2).				

24.5 Guidance on Hand Stiffness Test

Please perform the Hand Stiffness Test at every study Visit on both hands irrespective of any clinical signs or symptoms. The subject will be asked to bend simultaneously the four fingers of both hands, i.e. index, middle, ring, and little finger and the range of motion will be measured with a measuring device. Special attention should be paid to measuring consistently to the same part of the ball of the thumb, i.e. on the thenar eminence.

When measuring the distance in cm between the fingers and the ball of the thumb, the distance between the ball of the thumb and the finger that is least flexible/mobile should be documented for the right and the left hand in the source document. At subsequent visits, the same least flexible finger of each hand should be measured and recorded in the source document.

Normal finger flexion:

The measurement for a normal exam with full flexion/mobility should be zero cm/inch.

Abnormal finger flexion:

(1) Simultaneous

(2) Non-simultaneous

If the subject cannot bend fingers simultaneously, the distance in cm/inch between the ball of the thumb, i.e. on the thenar eminence, and the finger that is least flexible/mobile should be documented for the **right and the left hand**.

When measuring the distance in cm/inch between the fingers and the ball of the thumb, the distance between the ball of the thumb and the finger that is least flexible/mobile should be documented **for the right and the left hand** in the source

document. At subsequent visits, the same least flexible finger of each hand should be measured and recorded in the source document.
